

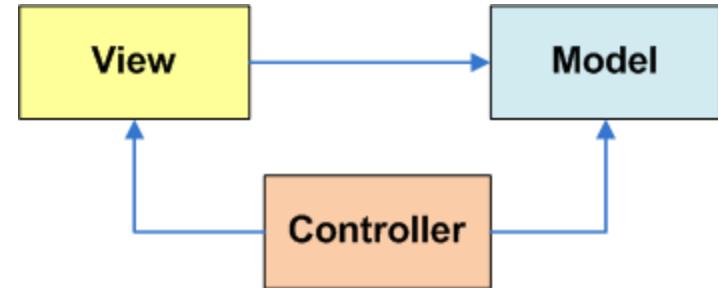

Graphical User Interfaces

Victor Matos

Cleveland State University

The Model-View-Controller (MVC) Pattern

The *Model-View-Controller (MVC)* is an important software design pattern whose main goal is to separate the (1) user interface, (2) business, and (3) input logic.

How is this seen by the Android developer?

- **Model.** Consists of the Java code and API objects used to manage the behavior and data of the application.
- **View.** Set of screens the user sees and interacts with.
- **Controller.** Implemented through the Android OS, responsible for interpretation of the user and system inputs. Input may come from a variety of sources such as the trackball, keyboard, touchscreen, GPS chip, background services, etc, and tells the Model and/or the View (usually through callbacks and registered listeners) to change as appropriate.

The Model-View-Control (MVC) Pattern

Getting ready to create MVC conforming solutions

The Android developer should be aware of ...

- **Inputs** could be sent to the application from various physical/logical components. Reacting to those signals is typically handled by **callback methods**. Usually there are many of them, you want to learn how to choose the appropriate one.
- Moving to states in the **lifecycle** is tied to logic in the model. For instance, if forced to *Pause* you may want to save uncommitted data.
- A **notification** mechanism is used to inform the user of important events happening *outside* the current application (such as arrival of a text message or email, fluctuations of the stock market, etc) and consequently choose how to proceed.
- **Views** are unlimited in terms of aesthetic and functionality. However physical constraints such as size, and hardware acceleration (or lack of) may affect how graphical components are managed.

Android & the MVC Pattern

The View - User Interfaces (Uis)

Android **graphical interfaces** are usually implemented as XML files (although they could also be dynamically created from Java code).

An Android UI is conceptually similar to a common HTML page

- **In a manner similar to a web page interaction**, when the Android user touches the screen, the controller interprets the input and determines what specific portion of the screen and gestures were involved. Based on this information it tells the model about the interaction in such a way that the appropriate “callback listener” or lifecycle state could be called into action.
- **Unlike a web application** (which refreshes its pages after explicit requests from the user) an asynchronous Android background service could quietly notify the controller about some change of state (such as reaching a given coordinate on a map) and in turn a change of the view’s state could be triggered; all of these without user intervention.

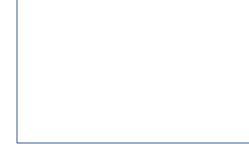

UI Design Patterns

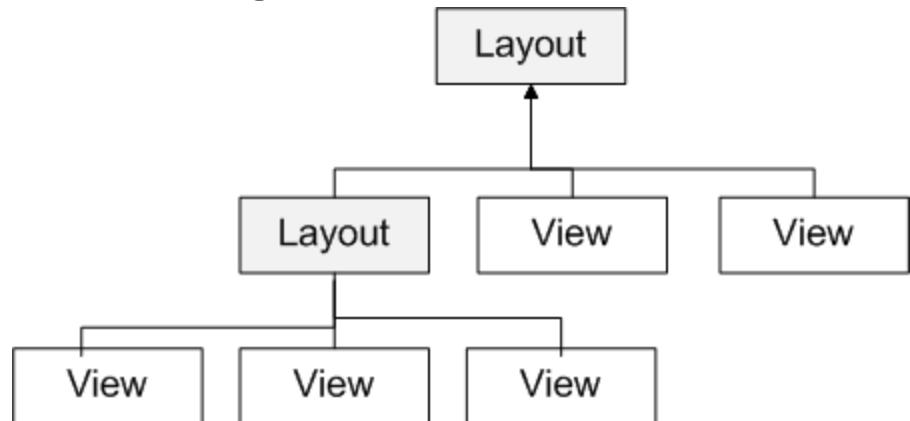

For a detailed discussion on **Android UI Design Patterns** see video:

http://www.youtube.com/watch?v=M1ZBjICRfz0&feature=player_embedded

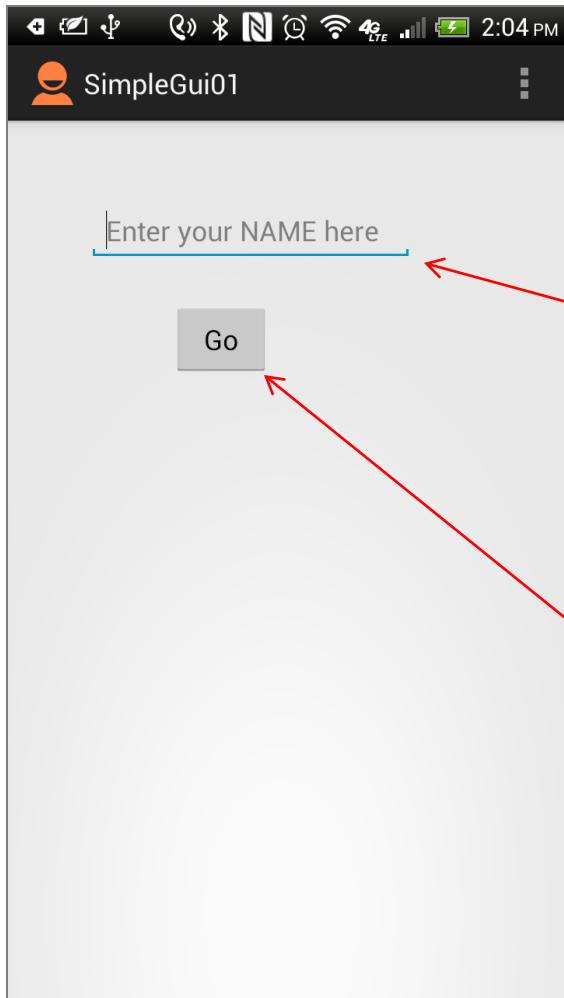

The View Class

- The **View class** is the Android's most basic component from which users interfaces can be created. It acts as a container of displayable elements.
- A **View** occupies a rectangular area on the screen and is responsible for *drawing* and *event handling*.
- **Widgets** are subclasses of View. They are used to create interactive UI components such as buttons, checkboxes, labels, text fields, etc.
- **Layouts** are invisible containers used for holding other Views and nested layouts.

Graphical UI ↔ XML Layout

Actual UI displayed by the app

Text version: *activity_main.xml* file

```
<RelativeLayout  
    xmlns:android="http://schemas.android.com/apk/res/android"  
    xmlns:tools="http://schemas.android.com/tools"  
    android:layout_width="match_parent"  
    android:layout_height="match_parent"  
    android:paddingBottom="@dimen/activity_vertical_margin"  
    android:paddingLeft="@dimen/activity_horizontal_margin"  
    android:paddingRight="@dimen/activity_horizontal_margin"  
    android:paddingTop="@dimen/activity_vertical_margin"  
    tools:context=".MainActivity" >  
  
    <EditText  
        android:id="@+id/editText1"  
        android:layout_width="wrap_content"  
        android:layout_height="wrap_content"  
        android:layout_alignParentLeft="true"  
        android:layout_alignParentTop="true"  
        android:layout_marginLeft="35dp"  
        android:layout_marginTop="35dp"  
        android:ems="10"  
        android:hint="Enter your NAME here" />  
  
    <Button  
        android:id="@+id/button1"  
        android:layout_width="wrap_content"  
        android:layout_height="wrap_content"  
        android:layout_alignLeft="@+id/editText1"  
        android:layout_below="@+id/editText1"  
        android:layout_marginLeft="54dp"  
        android:layout_marginTop="26dp"  
        android:text="Go" />  
  
</RelativeLayout>
```

Using Views

- An Android's **XML** view file consists of a **layout** holding a hierarchical arrangement of its contained elements.
- The inner elements could be simple widgets or nested layouts holding some complex viewgroups.
- An Activity uses the **setContentView(R.layout.xmlfilename)** method to render a view on the device's screen.

The diagram illustrates an Android XML layout file. It starts with a `<LinearLayout>` tag. Inside this tag, there are several attributes: `xmlns:android="http://schemas.android.com/apk/res/android"`, `android:layout_width="match_parent"`, `android:layout_height="wrap_content"`, and `android:orientation="horizontal"`. A red arrow points from a red dot on the left to the first attribute. Below the closing tag, there is a blue brace that spans across the entire inner content of the `<LinearLayout>` tag, indicating that all the code within the brace is part of the layout's body. To the right of the brace, the text *Widgets and other nested layouts* is written in blue. A red arrow points from a red dot on the right to this text, suggesting that the layout can contain other views or nested layout structures.

```
<LinearLayout  
    xmlns:android="http://schemas.android.com/apk/res/android"  
    android:layout_width="match_parent"  
    android:layout_height="wrap_content"  
    android:orientation="horizontal" >  
  
    {  
        Widgets and other nested layouts  
    }  
/</LinearLayout>
```

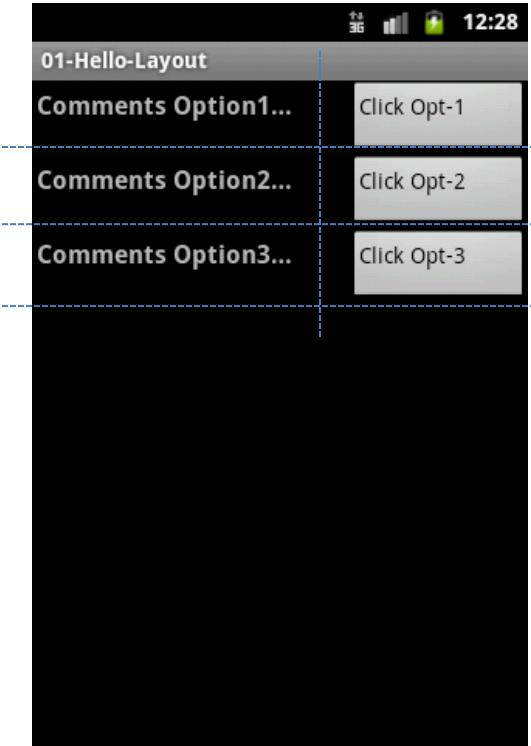

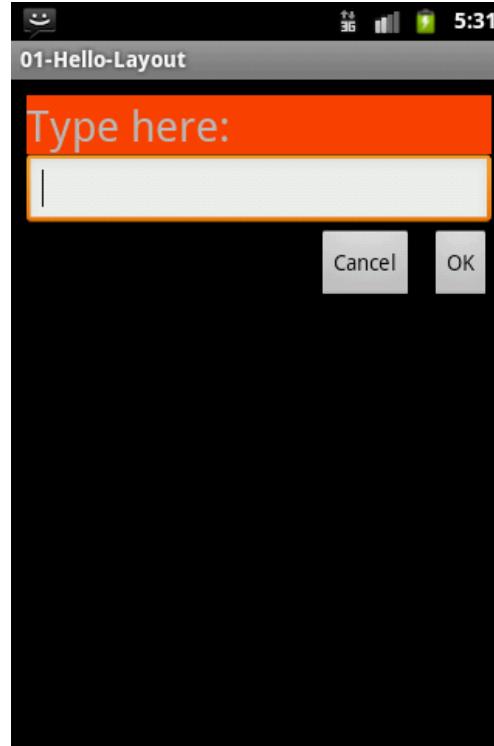

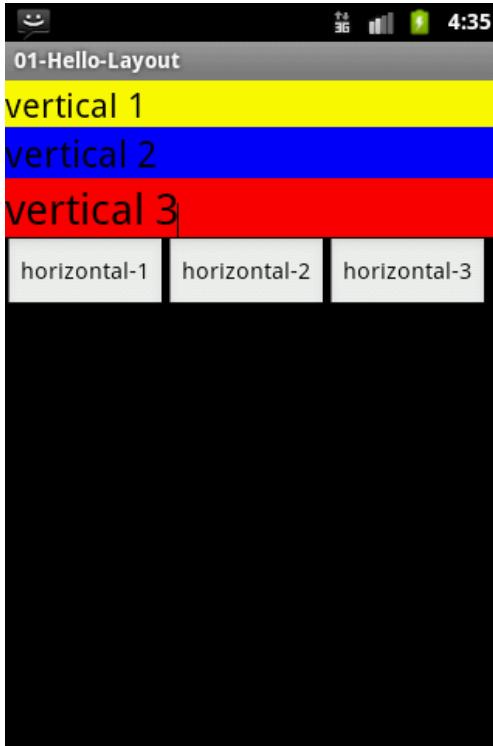

Using Views

Dealing with widgets & layouts typically involves the following operations

1. **Set properties:** For example setting the background color, text, font and size of a *TextView*.
2. **Set up listeners:** For example, an image could be programmed to respond to various events such as: click, long-tap, mouse-over, etc.
3. **Set focus:** To set focus on a specific view, you call the method `requestFocus()` or use XML tag `<requestFocus />`
4. **Set visibility:** You can hide or show views using `setVisibility(...)`.

A brief sample of UI components

Layouts

Linear Layout

A LinearLayout places its inner views either in horizontal or vertical disposition.

Relative Layout

A RelativeLayout is a ViewGroup that allows you to position elements relative to each other.

Table Layout

A TableLayout is a ViewGroup that places elements using a row & column disposition.

A brief sample of UI components

Widgets

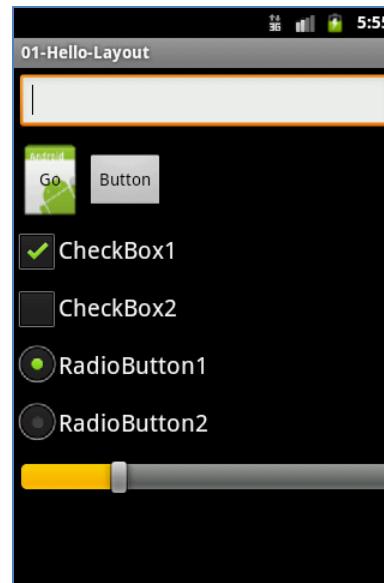

TimePicker

AnalogClock

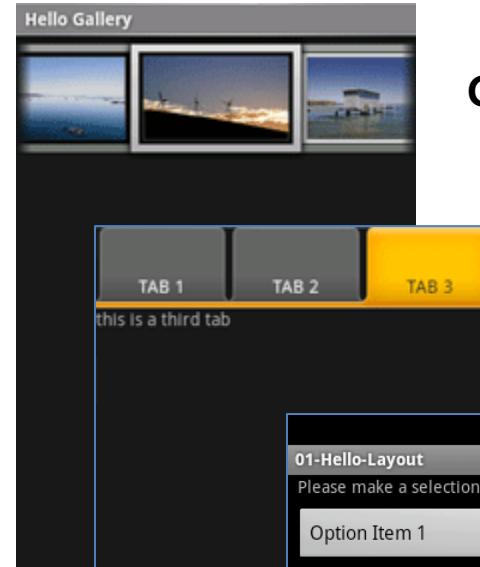

DatePicker

A *DatePicker* is a widget that allows the user to select a month, day and year.

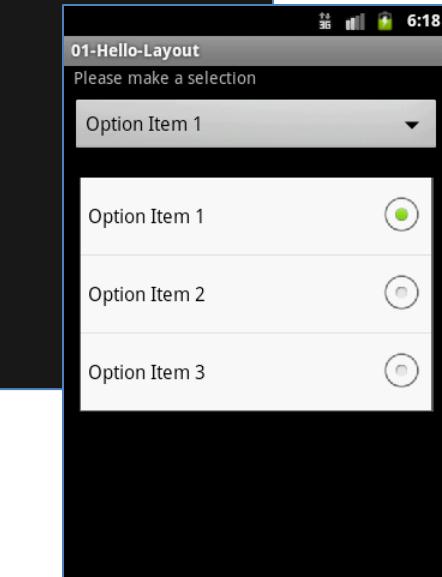

Form Controls

Includes a variety of typical form widgets, like:
image buttons,
text fields,
checkboxes and
radio buttons.

GalleryView

TabWidget

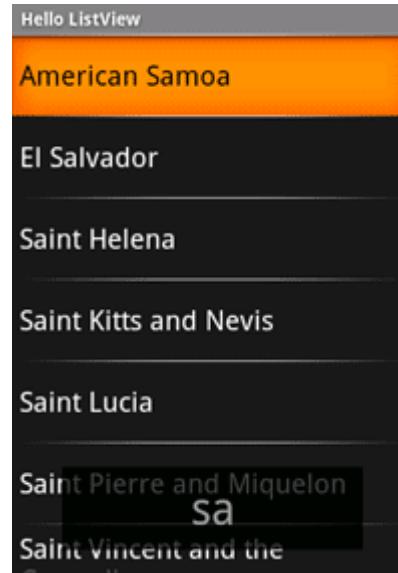

Spinner

A brief sample of UI components

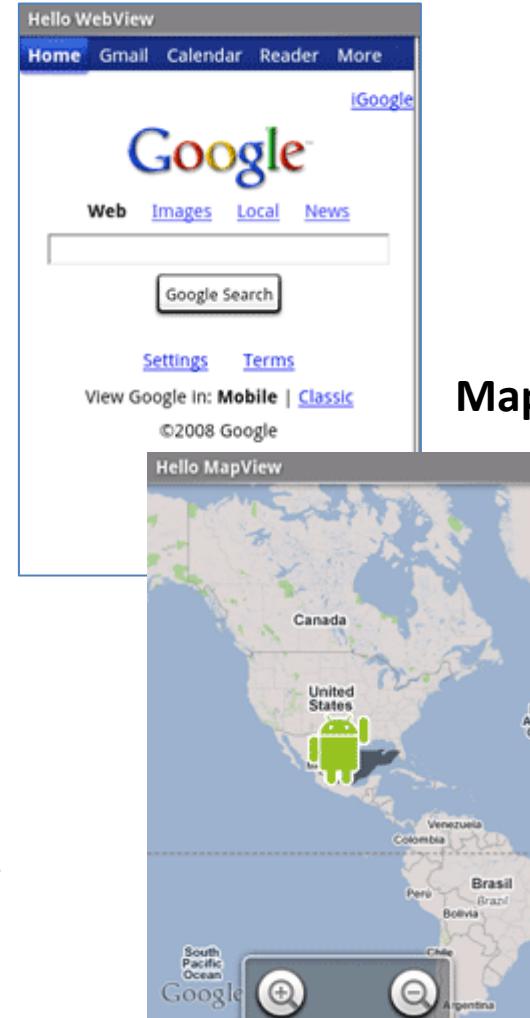

AutoCompleteTextView

It is a version of the *EditText* widget that will provide auto-complete suggestions as the user types. The suggestions are extracted from a collection of strings.

ListView

A *ListView* is a View that shows items in a vertically scrolling list. The items are acquired from a *ListAdapter*.

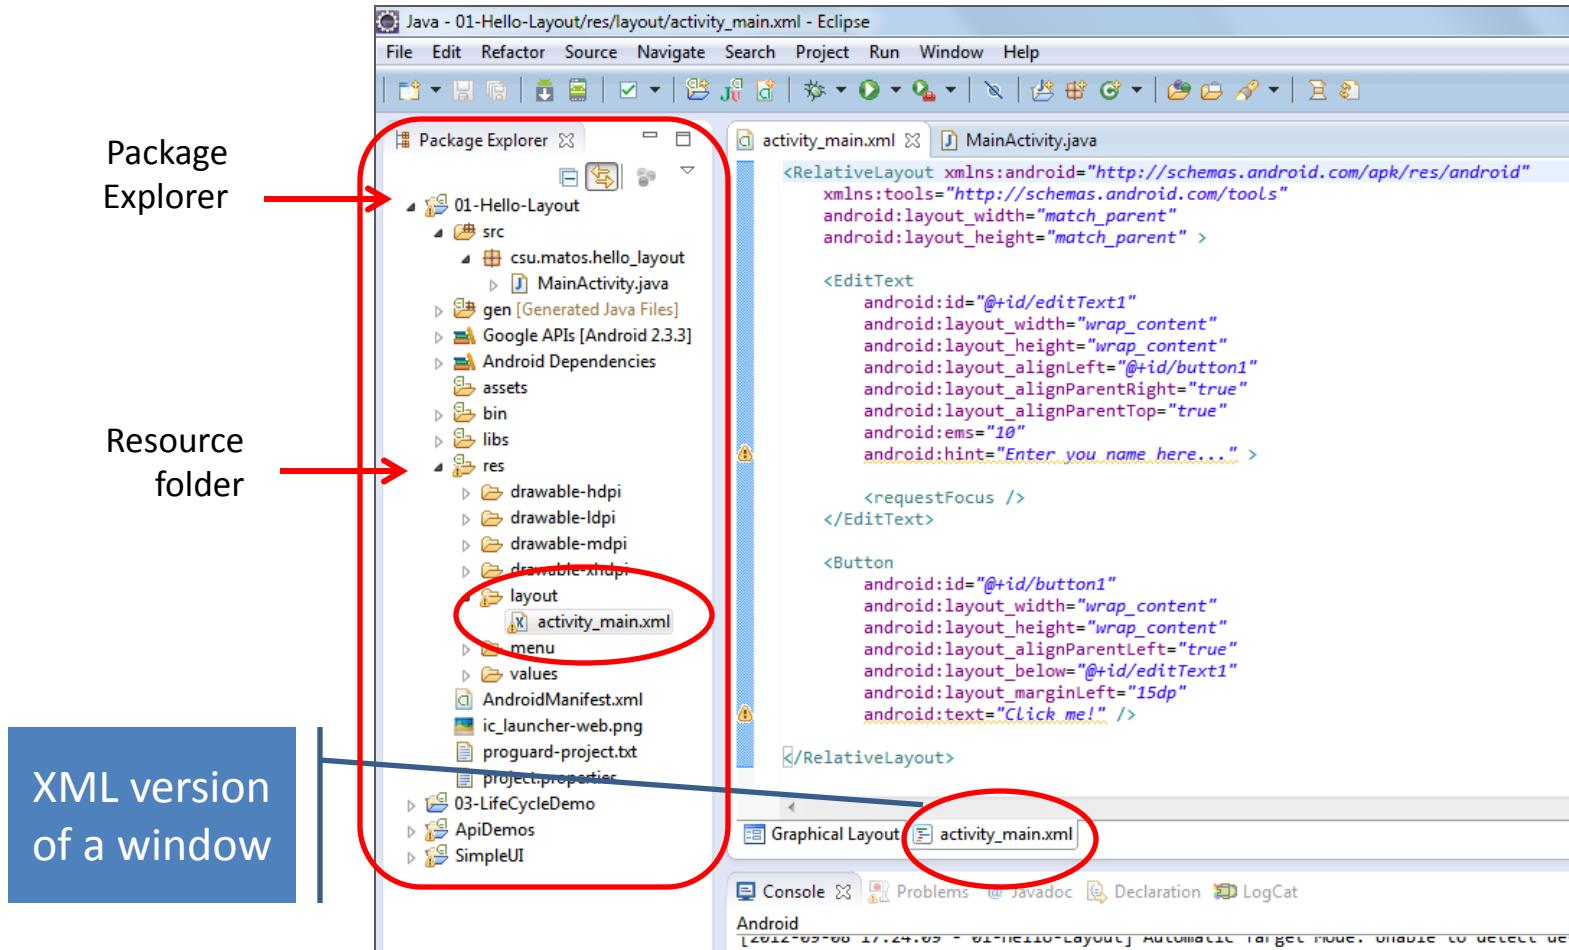

WebView

MapView

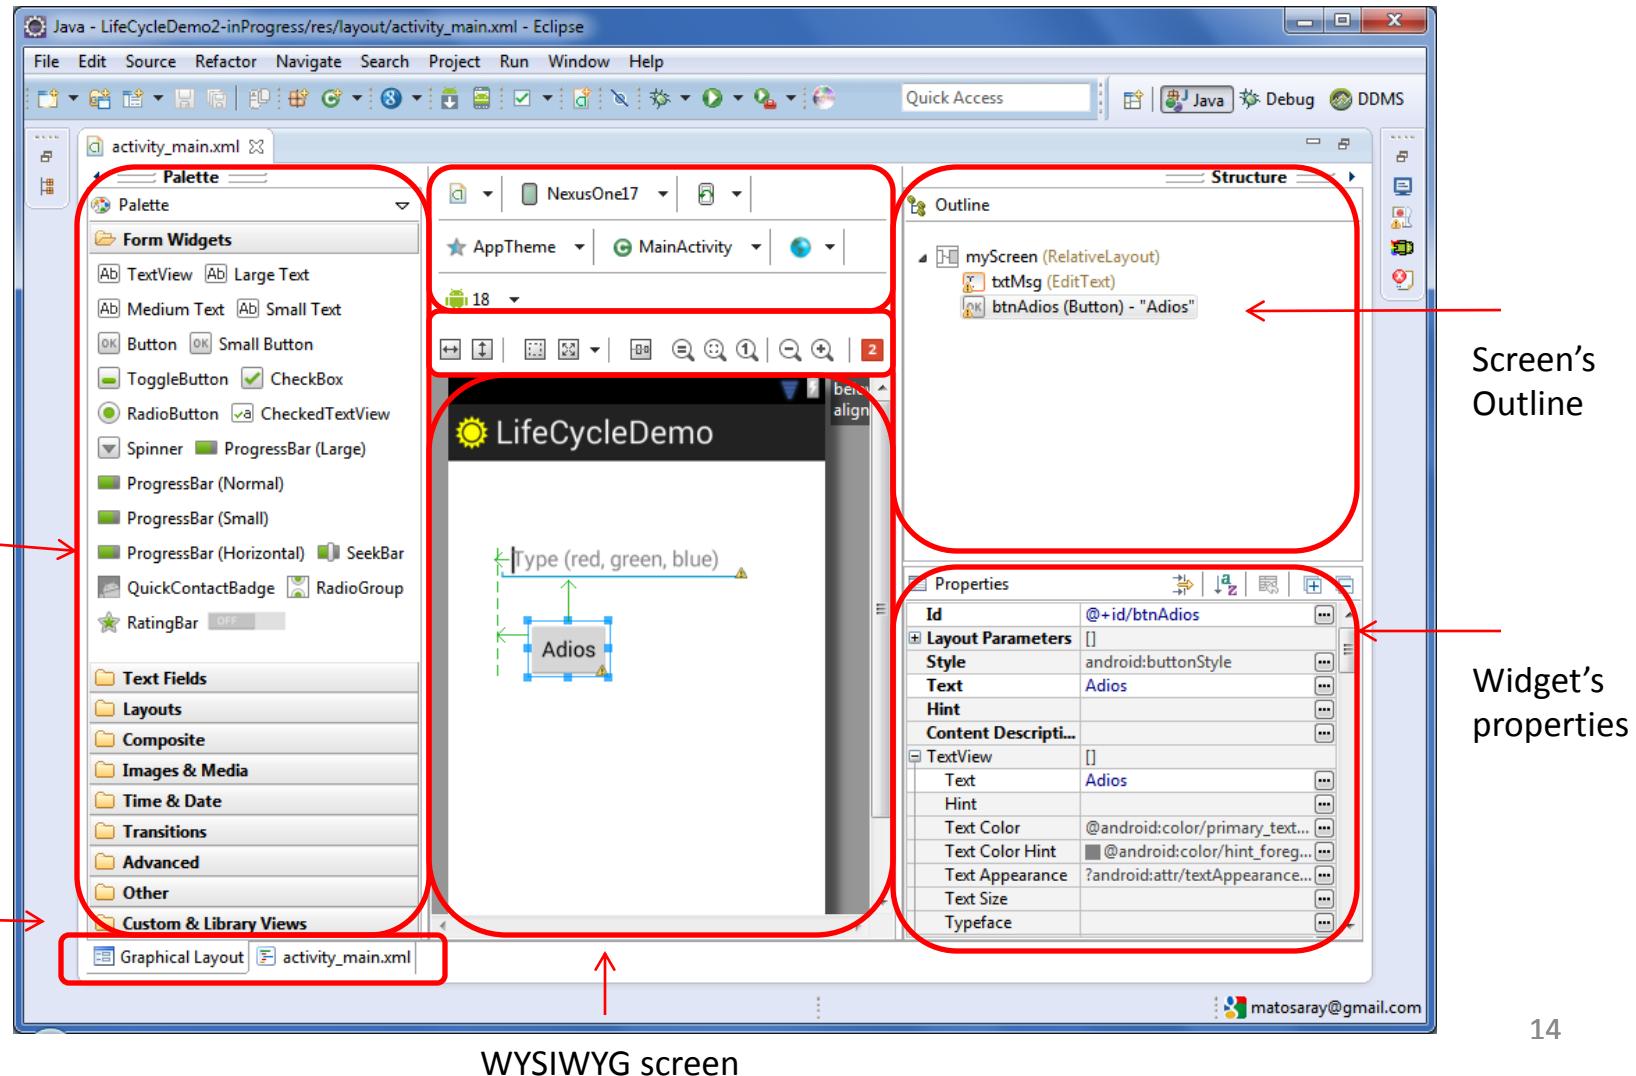

XML Layouts in Eclipse

Android considers XML-based layouts to be *resources*, consequently layout files are stored in the **res/layout** directory inside your Android project.

XML Layouts in Eclipse

The **Screen Designer Tool** included in Eclipse+ADT allows a dual view -WYSIWIG and XML- of each layout design held in the resource folder **res/layout/**

Tools for Android UI/XML Design

ASIDE ...

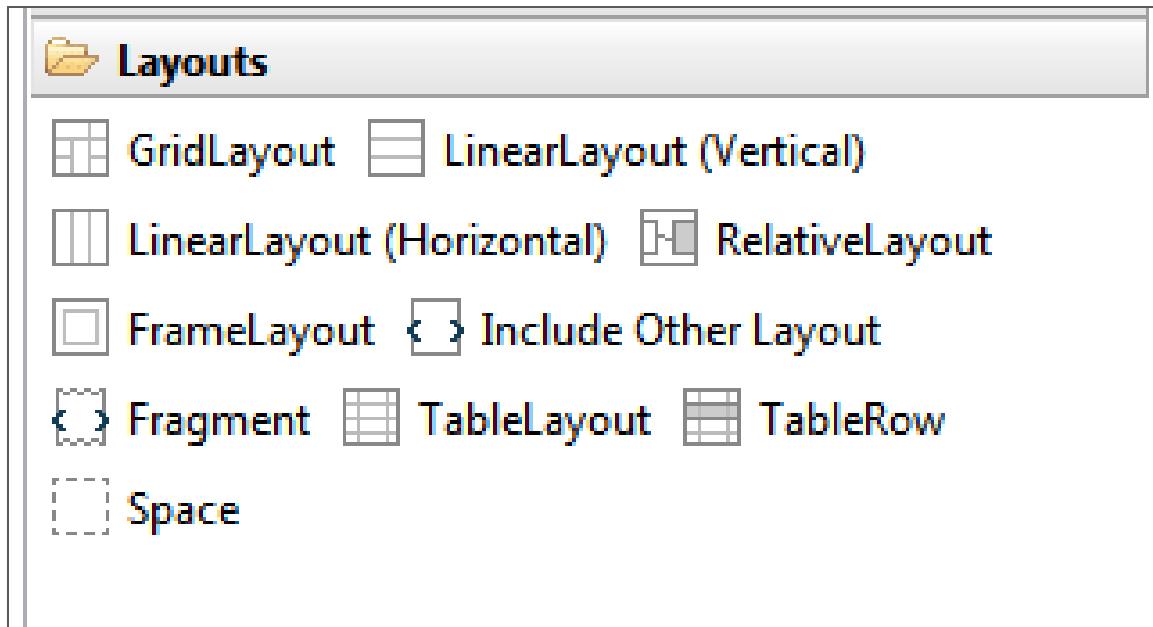

Alternative tools for creating Android apps:

- **Android Studio.** Based on IntelliJ IDEA. Similar to Eclipse with the ADT Plugin.
<http://developer.android.com/sdk/installing/studio.html>
- **Android SDK.** Streamlined workbench based on Eclipse+ADT in a simpler to install package.
<http://developer.android.com/sdk/index.html>
- **DroidDraw** Very simple GUI designer, incomplete, not integrated to the Eclipse IDE, aging! <http://www.droiddraw.org/>
- **App Inventor** (very promising & ambitious, ‘hides’ coding ...) <http://appinventor.mit.edu/>

More on this issue later...

How to create Android GUIs?

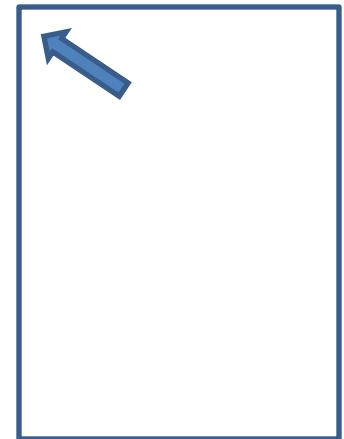

- Android *Layouts* are GUI containers having a predefined structure and placement policy.
- **Layouts can be nested**, therefore a cell, row, or column of a given layout could be another layout.
- The Eclipse+ADT workbench offers the following base types:

Common Layouts

FrameLayout

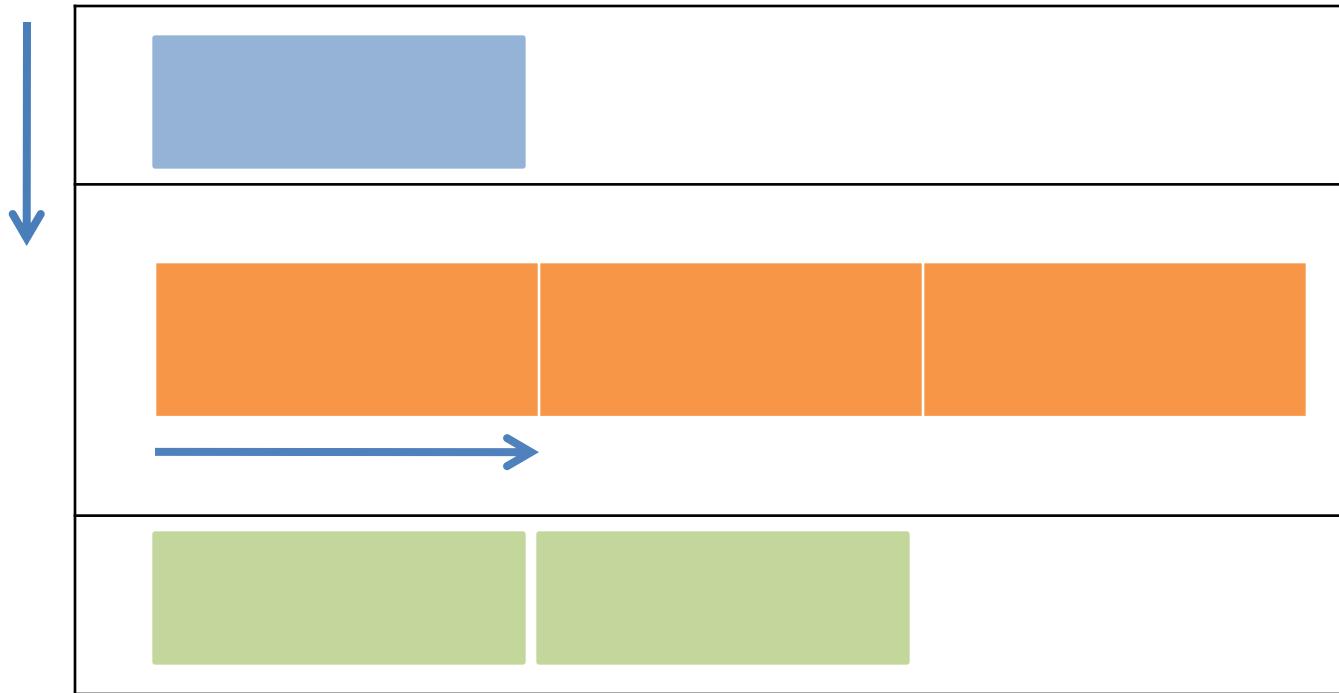

- FrameLayout is the simplest type of GUI container.
- Useful as outermost container holding a window.
- Allows you to define how much of the screen (high, width) is to be used.
- All its children elements are *aligned to the top left corner of the screen.*;

The Linear Layout

1. Linear Layout

- The **LinearLayout** supports a filling strategy in which new elements are stacked either in a **horizontal** or **vertical** fashion.
- If the layout has a vertical orientation new *rows* are placed one on top of the other.
- A horizontal layout uses a side-by-side *column* placement policy.

The Linear Layout

1. LinearLayout: Setting Attributes

Configuring a **LinearLayout** usually requires you to set the following attributes:

- orientation (*vertical, horizontal*)
- fill model (*match_parent, wrap_contents*)
- weight (*0, 1, 2, ...n*)
- gravity (*top, bottom, center,...*)
- padding (*dp – dev. independent pixels*)
- margin (*dp – dev. independent pixels*)

The LinearLayout - Orientation

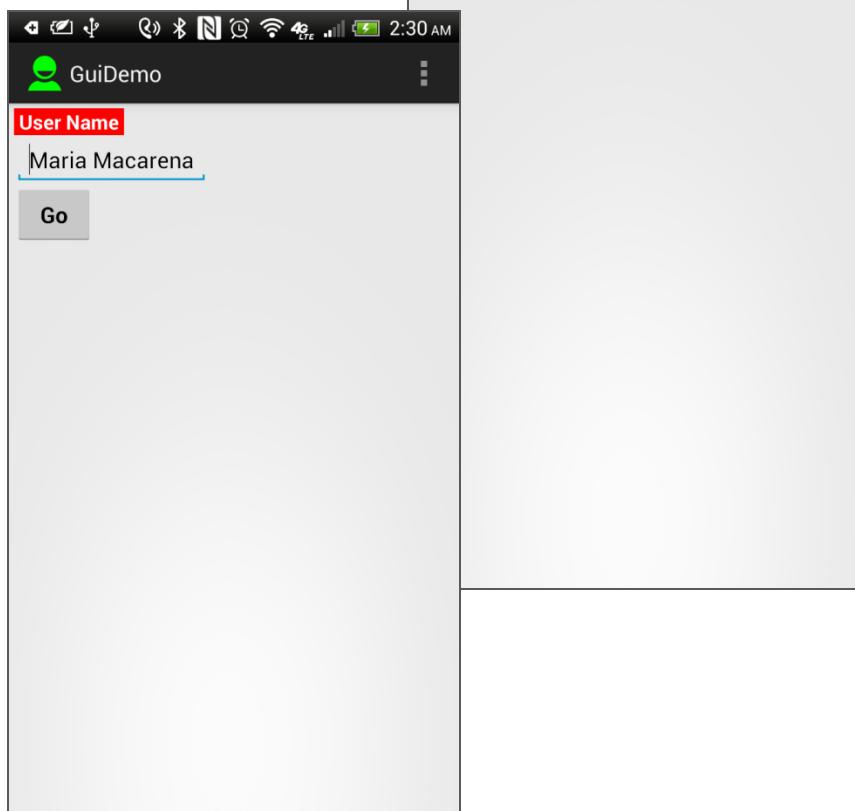

1.1 Attribute: Orientation

The **android:orientation** property can be set to:

horizontal for columns, or
vertical for rows.

Use *setOrientation()* for runtime changes.

v
e
r
t
i
c
a
l

horizontal

```
<LinearLayout
    xmlns:android="http://schemas.android.com/apk/res/android"
    android:id="@+id/myLinearLayout"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:orientation="horizontal"
    android:padding="4dp" >

    <TextView
        android:id="@+id/labelUserName"
        android:layout_width="wrap_content"
        android:layout_height="wrap_content"
        android:background="#ffff0000"
        android:text=" User Name "
        android:textColor="#ffffffff"
        android:textSize="16sp"
        android:textStyle="bold" />

    <EditText
        android:id="@+id/ediName"
        android:layout_width="wrap_content"
        android:layout_height="wrap_content"
        android:text="Maria Macarena"
        android:textSize="18sp" />

    <Button
        android:id="@+id/btnGo"
        android:layout_width="wrap_content"
        android:layout_height="wrap_content"
        android:text="Go"
        android:textStyle="bold" />

</LinearLayout>
```

The LinearLayout – Fill Model

1.2 Fill Model

- Widgets have a "**natural size**" based on their included text (rubber band effect).
- On occasions you may want your widget to have a specific space allocation (height, width) even if no text is initially provided (as is the case of the empty text box shown below).

The LinearLayout – Fill Model

1.2 Fill Model

All widgets inside a LinearLayout **must** include ‘width’ and ‘height’ attributes.

android:layout_width
android:layout_height

Values used in defining height and width can be:

1. A specific dimension such as **125dp** (device independent pixels, a.k.a. **dip**)
2. **wrap_content** indicates the widget should just fill up its natural space.
3. **match_parent** (previously called ‘**fill_parent**’) indicates the widget wants to be as big as the enclosing parent.

The LinearLayout – Fill Model

1.2 Fill Model

Medium resolution is: 320 x 480 dpi.

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout
    xmlns:android="http://schemas.android.com/apk/res/android"
        android:id="@+id/myLinearLayout"
        android:layout_width="match_parent"
        android:layout_height="match_parent"
        android:background="#ff0033cc"
        android:orientation="vertical"
        android:padding="4dp" >
```

Row-wise

```
<TextView
    android:id="@+id/LabelUserName"
    android:layout_width="_parent"
    android:layout_height="wrap_content"
    android:background="#fffff0066"
    android:text="User Name"
    android:textColor="#ff000000"
    android:textSize="16sp"
    android:textStyle="bold" />
```

Use all the row

```
<EditText
    android:id="@+id/ediName"
    android:layout_width="match_parent"
    android:layout_height="wrap_content"
    android:textSize="18sp" />
```

```
<Button
    android:id="@+id/btnGo"
    android:layout_width="125dp"
    android:layout_height="wrap_content"
    android:text="Go"
    android:textStyle="bold" />
```

Specific size: 125dp

```
</LinearLayout>
```

The LinearLayout – Weight

1.2 Weight

Indicates how much of the extra space in the LinearLayout will be allocated to the view. Use **0** if the view should not be stretched. The bigger the weight the larger the extra space given to that widget.

Example

The XML specification for this window is similar to the previous example.

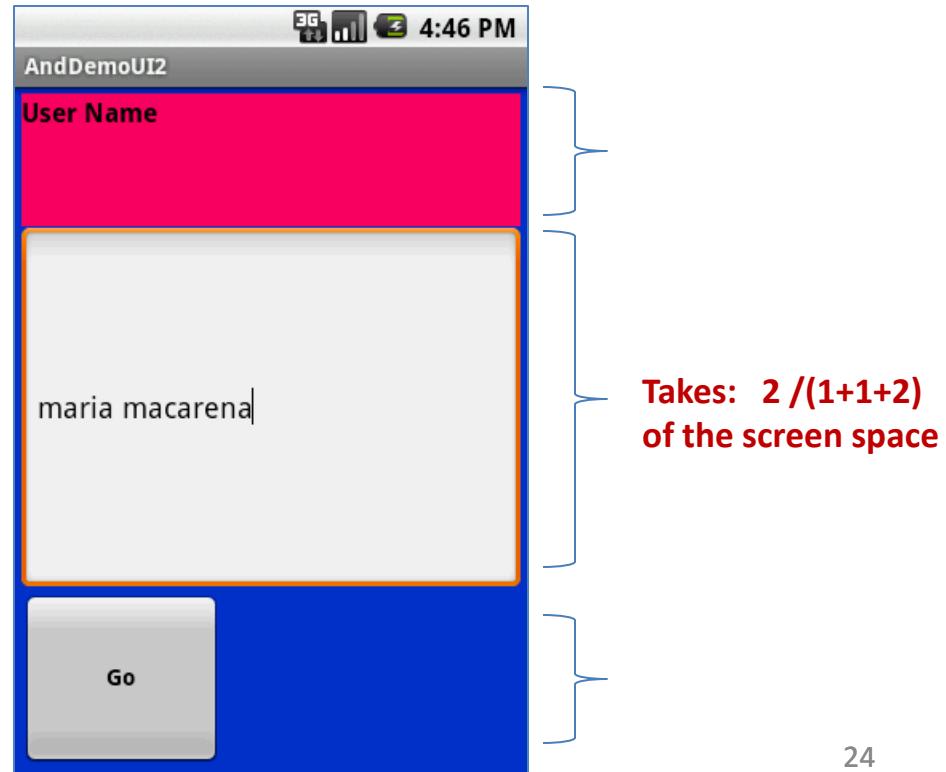

The TextView and Button controls have the additional property

`android:layout_weight="1"`

whereas the EditText control has

`android:layout_weight="2"`

Default value is 0

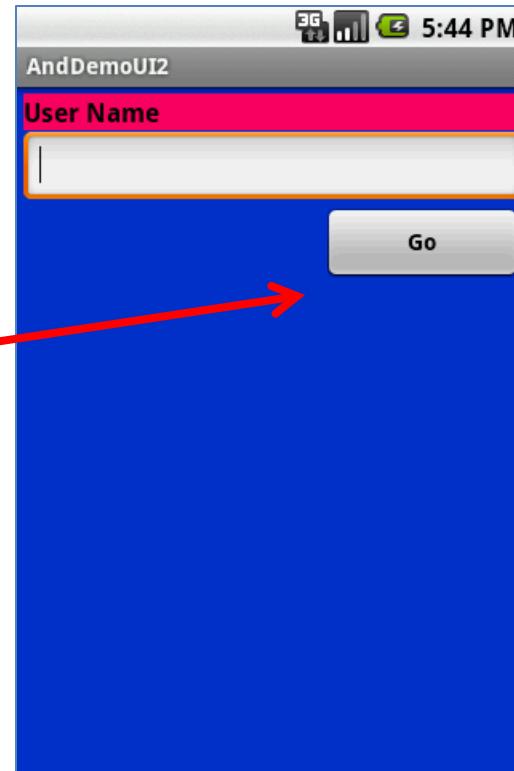

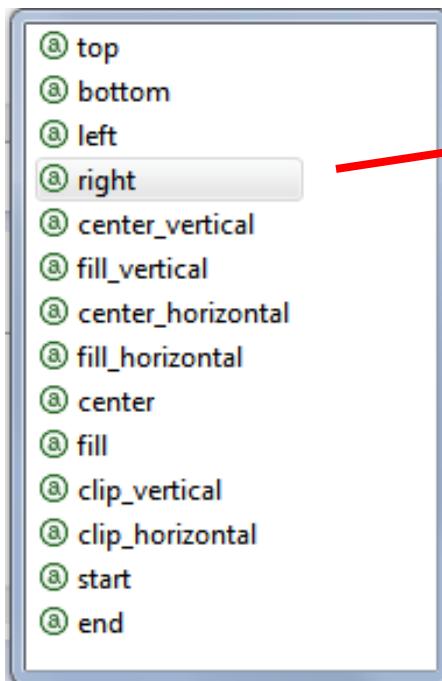

The LinearLayout – Gravity

1.3 Layout_Gravity

- It is used to indicate how a control will align on the screen.
- By default, widgets are *left*- and *top*-aligned.
- You may use the XML property

`android:layout_gravity="..."`

to set other possible arrangements:
left, center, right, top, bottom, etc.

Button has
right
layout_gravity

The LinearLayout – Gravity

1.3 CAUTION: gravity vs. layout_gravity

The difference between:

android:gravity

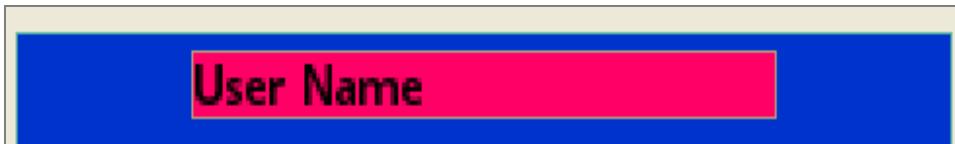

indicates how to place an object within a container. In the example
the text is centered **android:gravity="center"**

android:layout_gravity

positions the view with respect to its

android:layout_gravity="center"

The LinearLayout – Padding

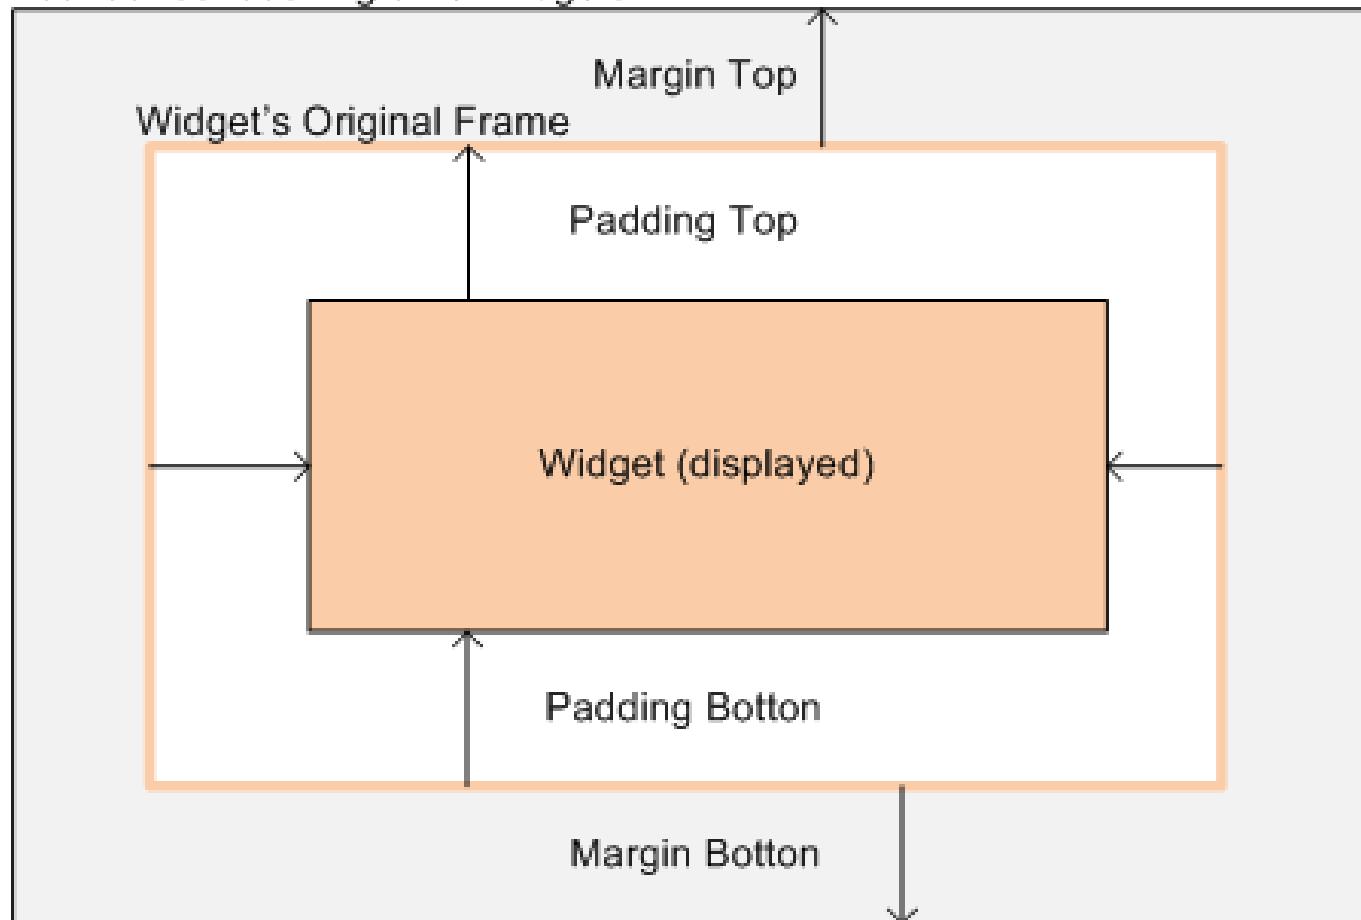

1.4 Padding

- The **padding** attribute specifies the widget's internal margin (in **dp** units).
- The internal margin is the extra space between the borders of the widget's "cell" and the actual widget contents.
- Either use
 - **android:padding** property
 - or call method **setPadding()** at runtime.

The LinearLayout – Padding

1.3 Padding and Marging

Boundaries touching other widgets

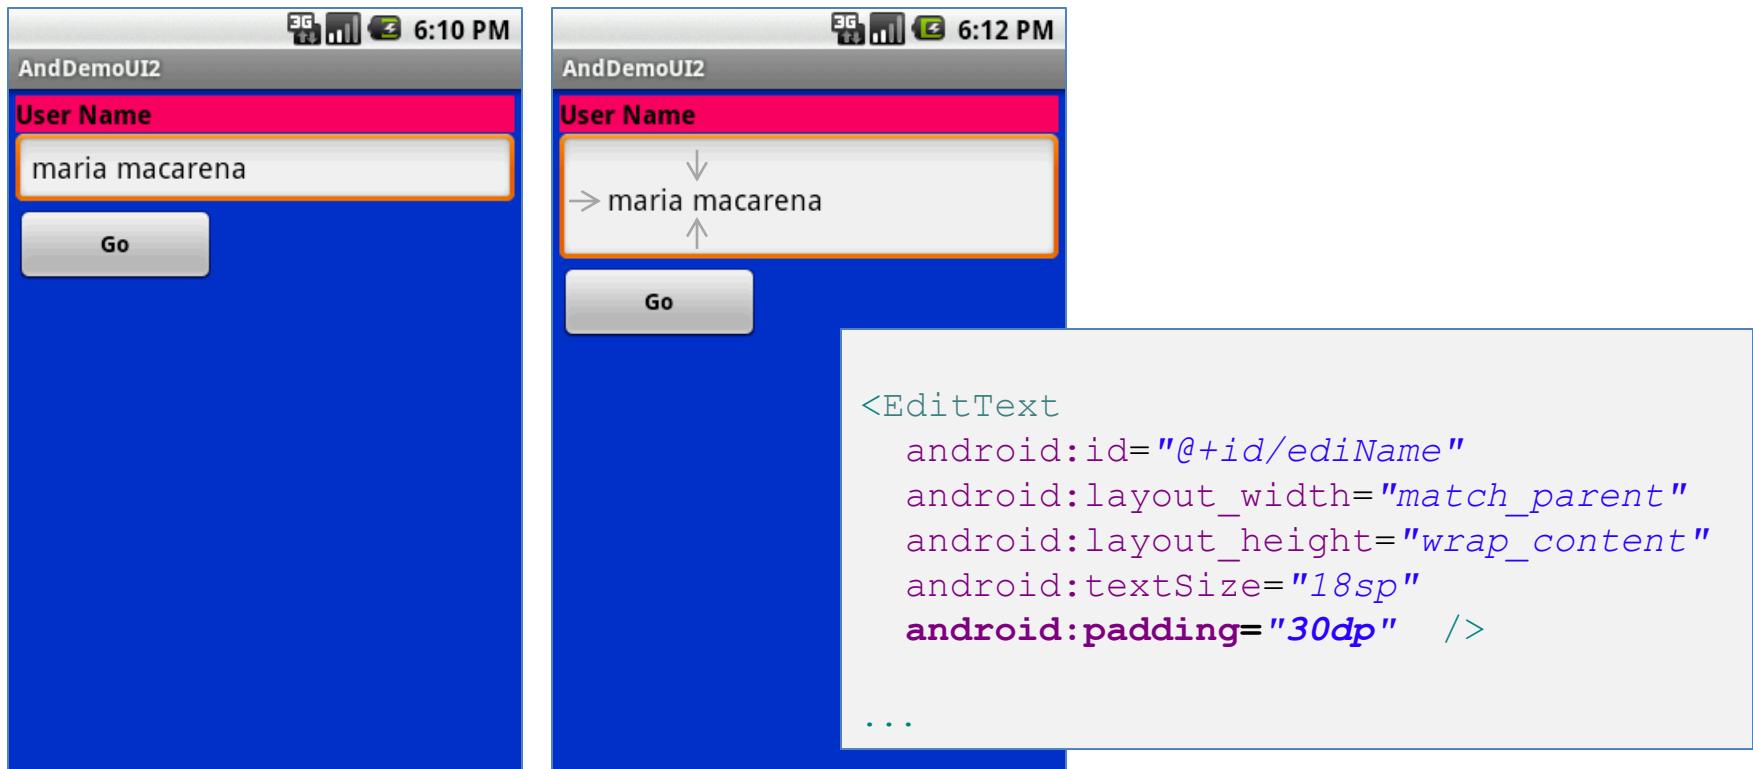

The LinearLayout – Padding

1.3 Internal Margins Using Padding

Example:

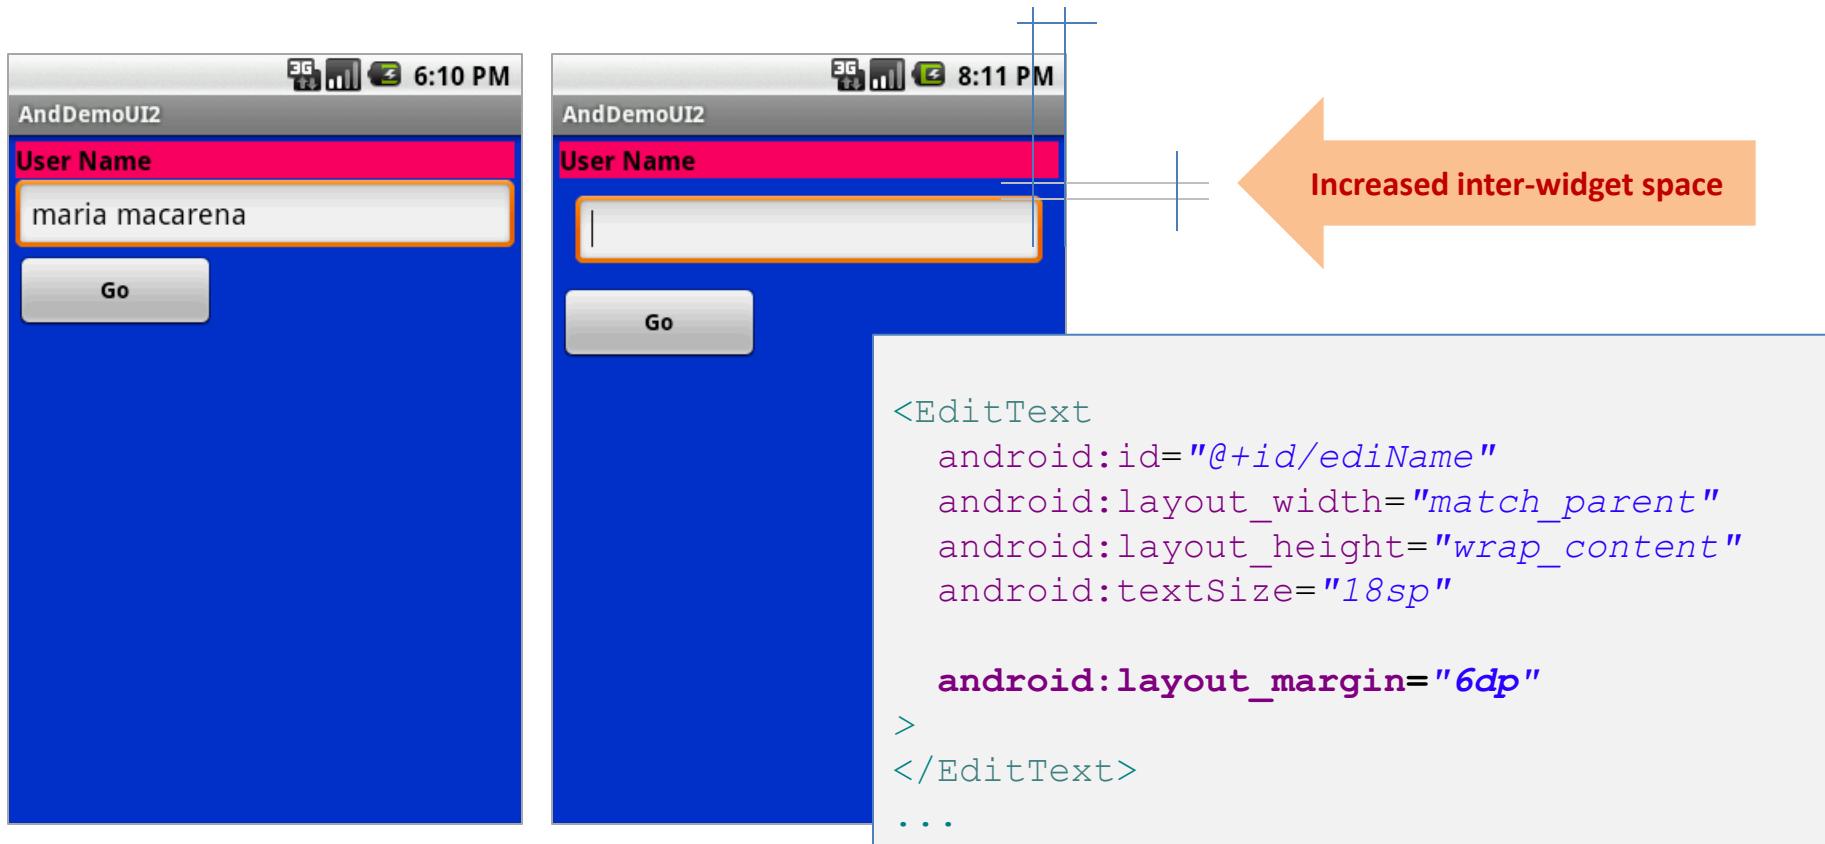

The EditText box has been changed to display 30dp of padding all around

The LinearLayout – Margin

1.4 (External) Margin

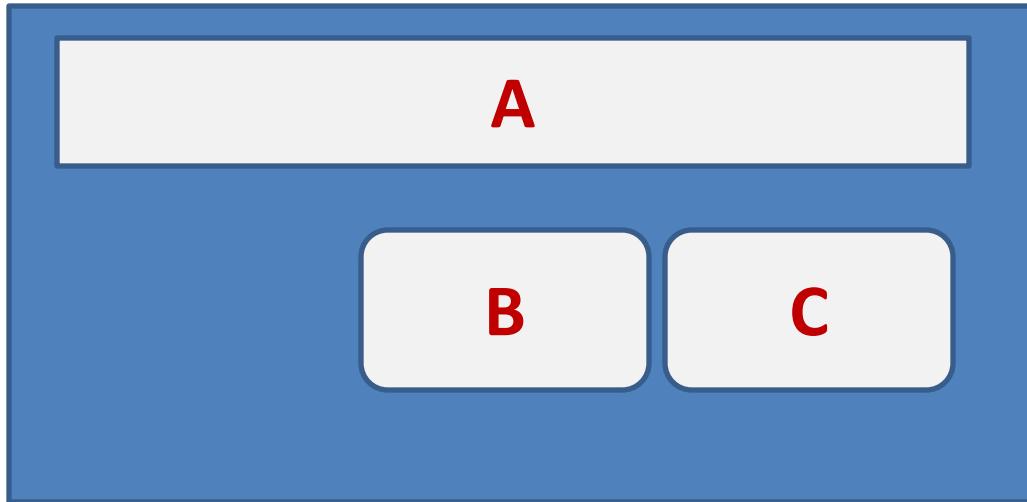

- Widgets –by default– are tightly packed next to each other.
- To increase space between them use the **android:layout_margin** attribute

The Relative Layout

2. Relative Layout

The placement of widgets in a **RelativeLayout** is based on their *positional relationship* to other widgets in the container and the parent container.

Example:

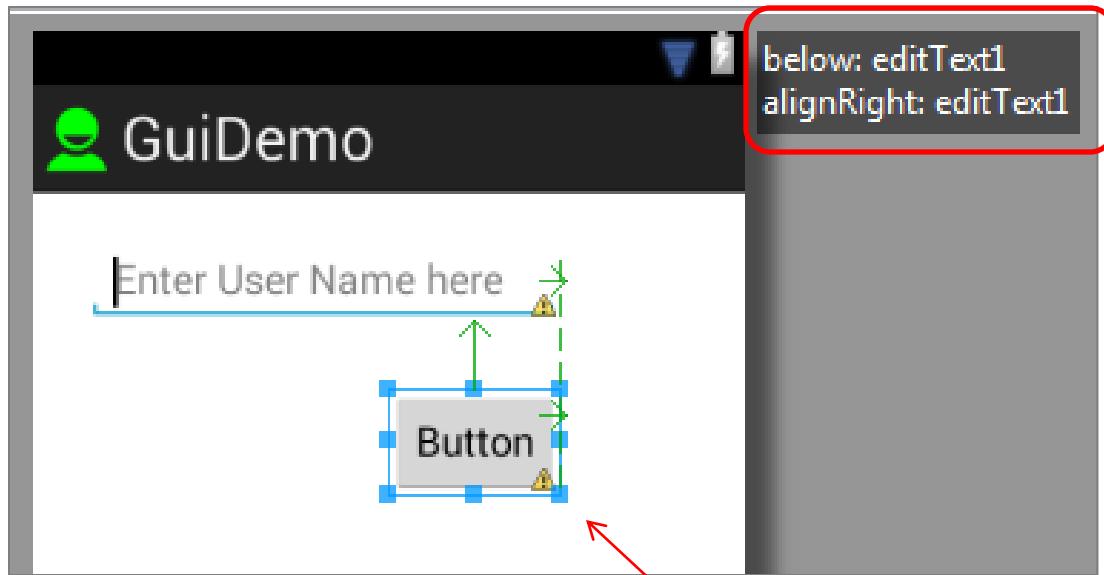

A is by the parent's top

C is below A, to its right

B is below A, to the left of C

The Relative Layout

2. Example: Relative Layout

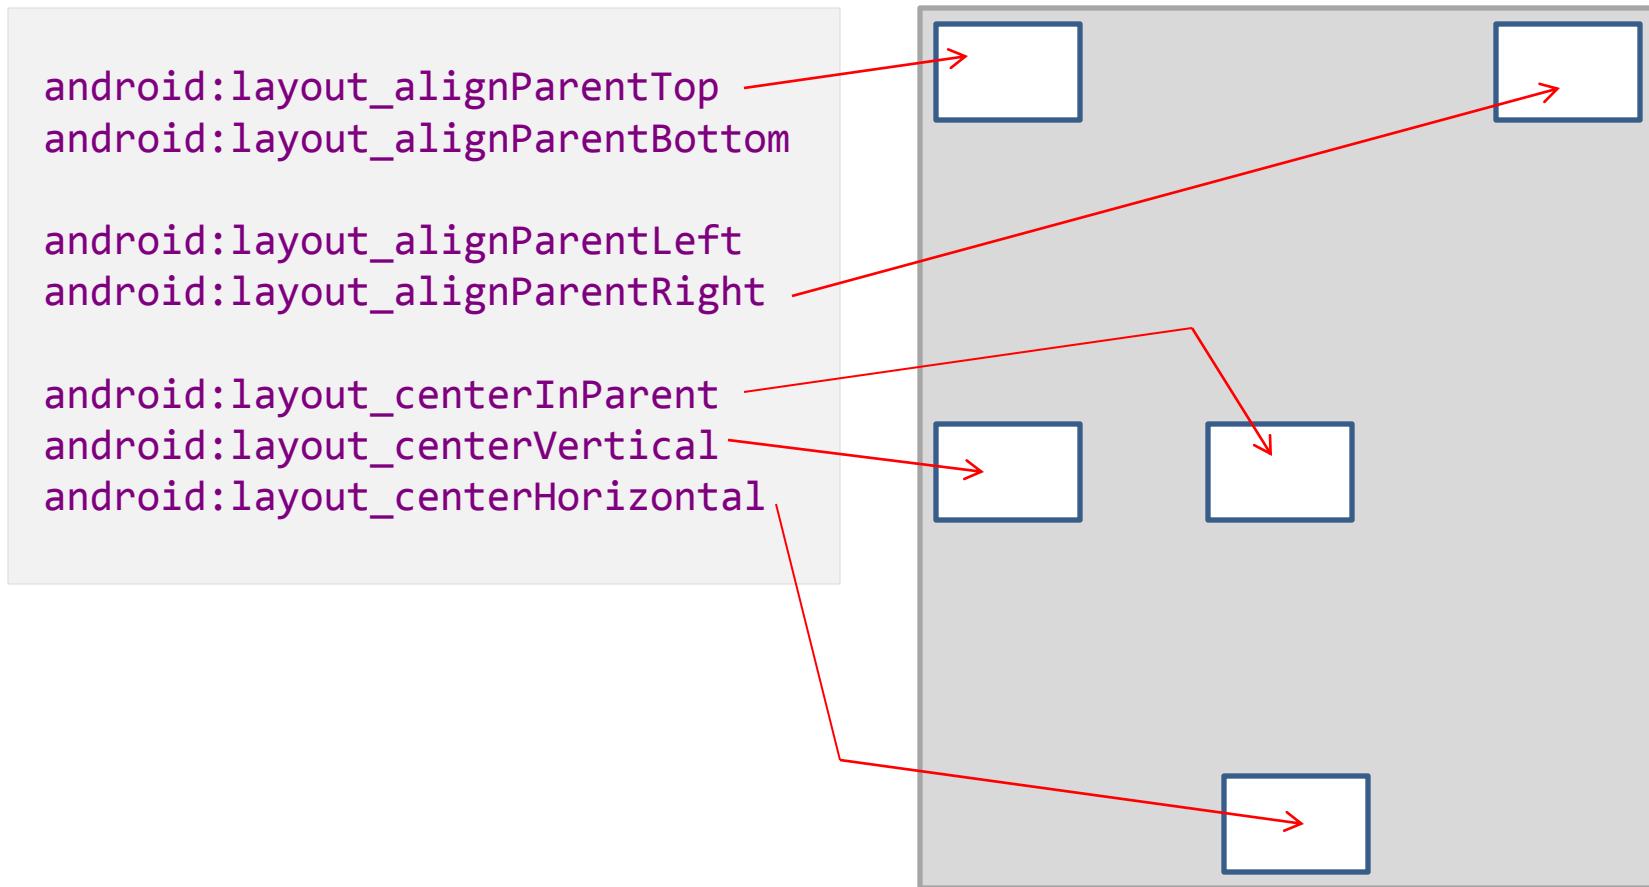

Location of the button is expressed in reference to its relative position with respect to the EditText box.

The Relative Layout

2. Referring to the container

Below there is a list of some positioning XML **boolean** properties (=“true/false”) useful for collocating a widget based on the location of its **parent** container.

The Relative Layout

2. Referring to other widgets

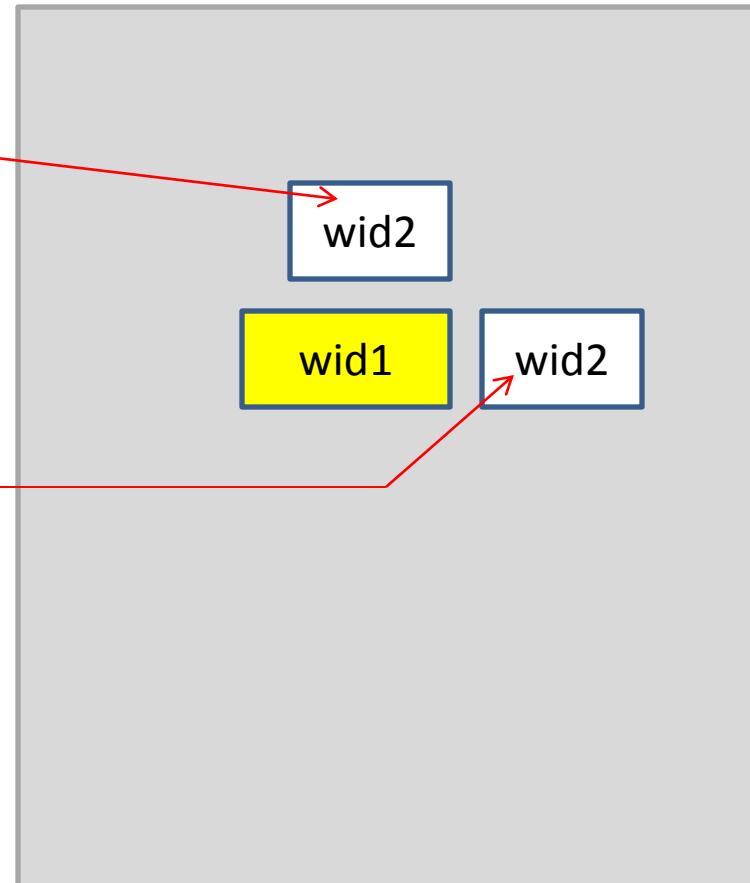

The following properties manage the positioning of a widget **respect to other widgets**:

`android:layout_above="@+id/wid1"`

`android:layout_below`

`android:layout_toLeftOf`

`android:layout_toRightOf`

In this example widget “wid2” is map
relative to wid1 (known as “@+id/wid1”)

The Relative Layout

2. Referring to other widgets – cont.

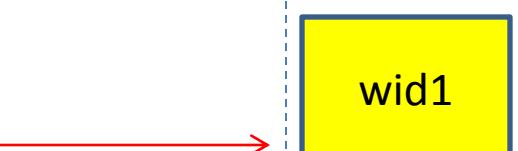

```
android:layout_alignTop="@+id/wid1"
```

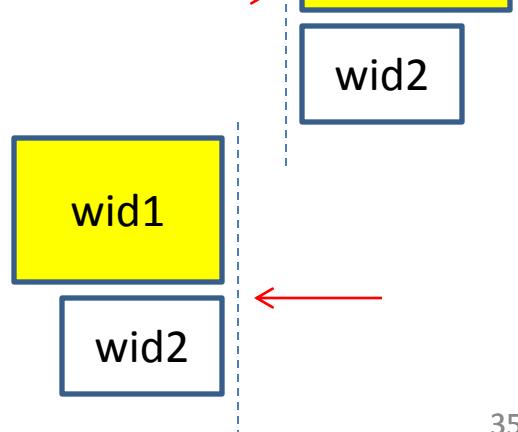

```
android:layout_alignBottom = "@+id/wid1"
```

```
android:layout_alignLeft="@+id/wid1"
```

```
android:layout_alignRight="@+id/wid1"
```

The Relative Layout

2. Referring to other widgets

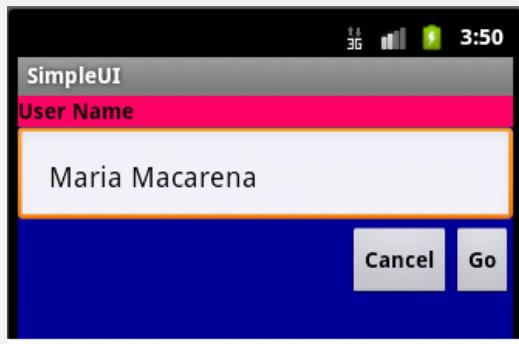

When using relative positioning you need to:

1. Use identifiers (**android:id** attributes) on *all elements* that you will be referring to.
2. XML elements are named using the prefix: `@+id/...`. For instance an EditText box could be called: `android:id="@+id/txtUserName"`
3. You must refer only to widgets that have been already defined. For instance a new control to be positioned below the `txtUserName` EditText box could refer to it using: `android:Layout_below="@+id/txtUserName"`

The RelativeLayout

2. Example

```
<RelativeLayout  
    xmlns:android="http://schemas.android.com/apk/res/android"  
        android:id="@+id/myRelativeLayout"  
        android:layout_width="match_parent"  
        android:layout_height="match_parent"  
        android:background="#ff000099" >  
  
<TextView  
    android:id="@+id/LblUserName"  
    android:layout_width="match_parent"  
    android:layout_height="wrap_content"  
    android:layout_alignParentLeft="true"  
    android:layout_alignParentTop="true"  
    android:background="#fffff0066"  
    android:text="User Name"  
    android:textColor="#ff000000"  
    android:textStyle="bold" >  
</TextView>
```

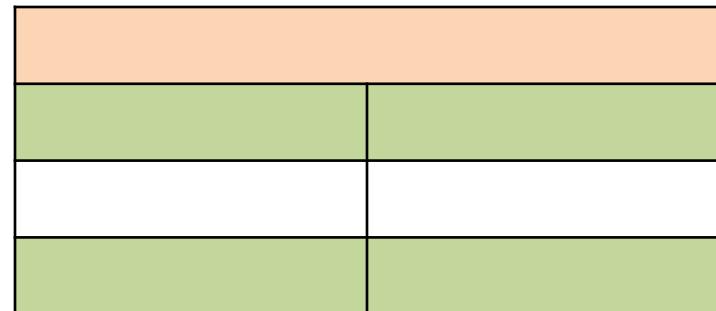

```
<EditText  
    android:id="@+id/txtUserName"  
    android:layout_width="match_parent"  
    android:layout_height="wrap_content"  
    android:layout_alignParentLeft="true"  
    android:layout_below="@+id/LblUserName"  
    android:padding="20dp" >  
</EditText>  
  
<Button  
    android:id="@+id	btnGo"  
    android:layout_width="wrap_content"  
    android:layout_height="wrap_content"  
  
    android:layout_alignRight="@+id/txtUserName"  
    android:layout_below="@+id/txtUserName"  
    android:text="Go"  
    android:textStyle="bold" >  
</Button>  
  
<Button  
    android:id="@+id btnCancel"  
    android:layout_width="wrap_content"  
    android:layout_height="wrap_content"  
    android:layout_below="@+id/txtUserName"  
    android:layout_toLeftOf="@+id(btnGo)"  
    android:text="Cancel"  
    android:textStyle="bold" >  
</Button>  
  
</RelativeLayout>
```

The Table Layout

3. Table Layout

1. Android's **TableLayout** uses a grid to position your widgets.
2. Like in a matrix, cells in the grid are identifiable by *rows* and *columns*.
3. Columns are flexible, they could *shrink* or *stretch* to accommodate their contents.
4. The element **TableRow** is used to define a new row in which widgets can be allocated.
5. The number of columns in a TableRow is determined by the total of side-by-side widgets placed on the row.

Basic XML Layouts - Containers

3. Table Layout – Setting Number of Columns

The number of columns in a row is determined by Android.

Example: If your TableLayout have three rows, one with two widgets, one with three widgets, and one with four widgets, there will be at least four columns.

0	1		
0	1	2	
0	1	2	3

Basic XML Layouts - Containers

3. Table Layout – Stretching a Column

- A single widget in a TableLayout can occupy more than one column.
- The `android:layout_span` property indicates the number of columns the widget is allowed to expand.

```
<TableRow>
    <TextView android:text="URL:" />
    <EditText
        android:id="@+id/entry"
        android:layout_span="3" />
</TableRow>
```

Basic XML Layouts - Containers

3. Table Layout – Stretching a Column

Widgets on a table's row are placed from left to right, beginning with the first available column. Each column in the table stretches to accommodate its hosted widgets.

Example: The table shown below has four columns (*indices*: 0,1,2,3). The label ("ISBN") goes in the first column (*index 0*). The EditText box uses the `layout_span` attribute to be placed into a spanned set of three columns (columns 1 through 3).

The diagram illustrates a 2x4 table layout. The table has two rows. The first row contains four cells: 'Label (ISBN)', 'EditText', 'EditText-span', and 'EditText-span'. The second row contains four cells: 'Column 0', 'Column 1', 'Column 2', and 'Column 3'. A blue double-headed arrow above the first row spans from the center of the 'EditText' cell to the center of the 'EditText-span' cell, indicating a span of three columns. A red double-headed arrow below the second row spans from the center of 'Column 1' to the center of 'Column 3', indicating a span of two columns. Yellow boxes highlight the attributes `android:layout_span="3"` and `android:layout_column="2"`.

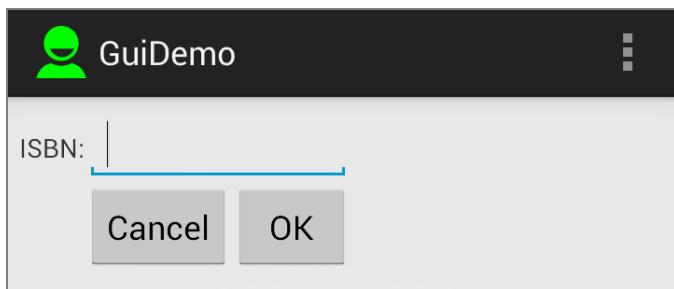

Label (ISBN)	EditText	EditText 	EditText
Column 0	Column 1	Column 2 Button Cancel	Column 3 Button OK

`android:layout_span="3"`

`android:layout_column="2"`

Basic XML Layouts - Containers

3. Table Layout Example

Note to the reader:
Experiment changing
layout_span to 1, 2, 3

```
<?xml version="1.0" encoding="utf-8"?>
<TableLayout
    xmlns:android="http://schemas.android.com/apk/res/android"
    android:id="@+id/myTableLayout"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:padding="6dp"
    android:orientation="vertical" >
    <TableRow>
        <TextView android:text="ISBN:" />
        <EditText
            android:id="@+id/ediISBN"
            android:layout_span="3" />
    </TableRow>

    <TableRow>
        <Button
            android:id="@+id/cancel"
            android:layout_column="2"
            android:text="Cancel" />
        <Button
            android:id="@+id/ok"
            android:text="OK" />
    </TableRow>
</TableLayout>
```

Occupies 3 columns

Skip columns 0, 1

Basic XML Layouts - Containers

3. Stretching the Entire Table

- By default, a column is as wide as the “natural” size of the widest widget collocated in this column (e.g. a column holding a button showing the caption “Go” is narrower than other column holding a button with the caption “Cancel”).
- A table does not necessarily take all the horizontal space available.
- If you want the table to (horizontally) match its container use the property:

```
android:stretchColumns="column(s)"
```

Its value is the column-index (or comma-separated column indices) to be stretched to take up any space still available on the row.

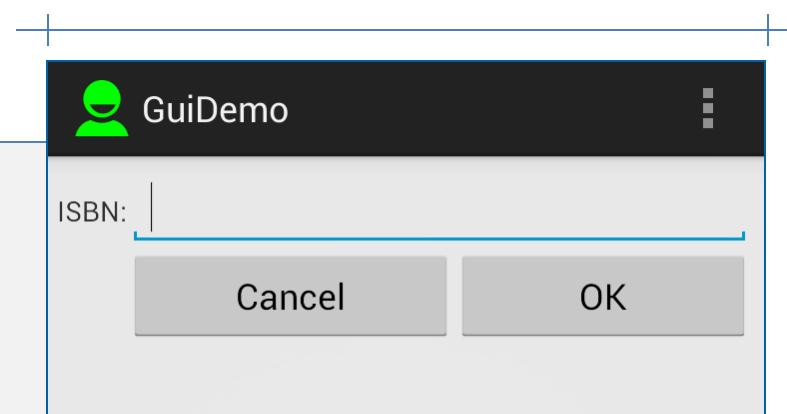

Basic XML Layouts - Containers

3. Example: Stretching the Entire Table

In our running example we stretch columns 2, 3, and 4 to fill the rest of the row.

```
...
<TableLayout
    android:id="@+id/myTableLayout"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:orientation="vertical"
    android:stretchColumns="2,3"
    xmlns:android="http://schemas.android.com/apk/res/android"
>
    ...

```

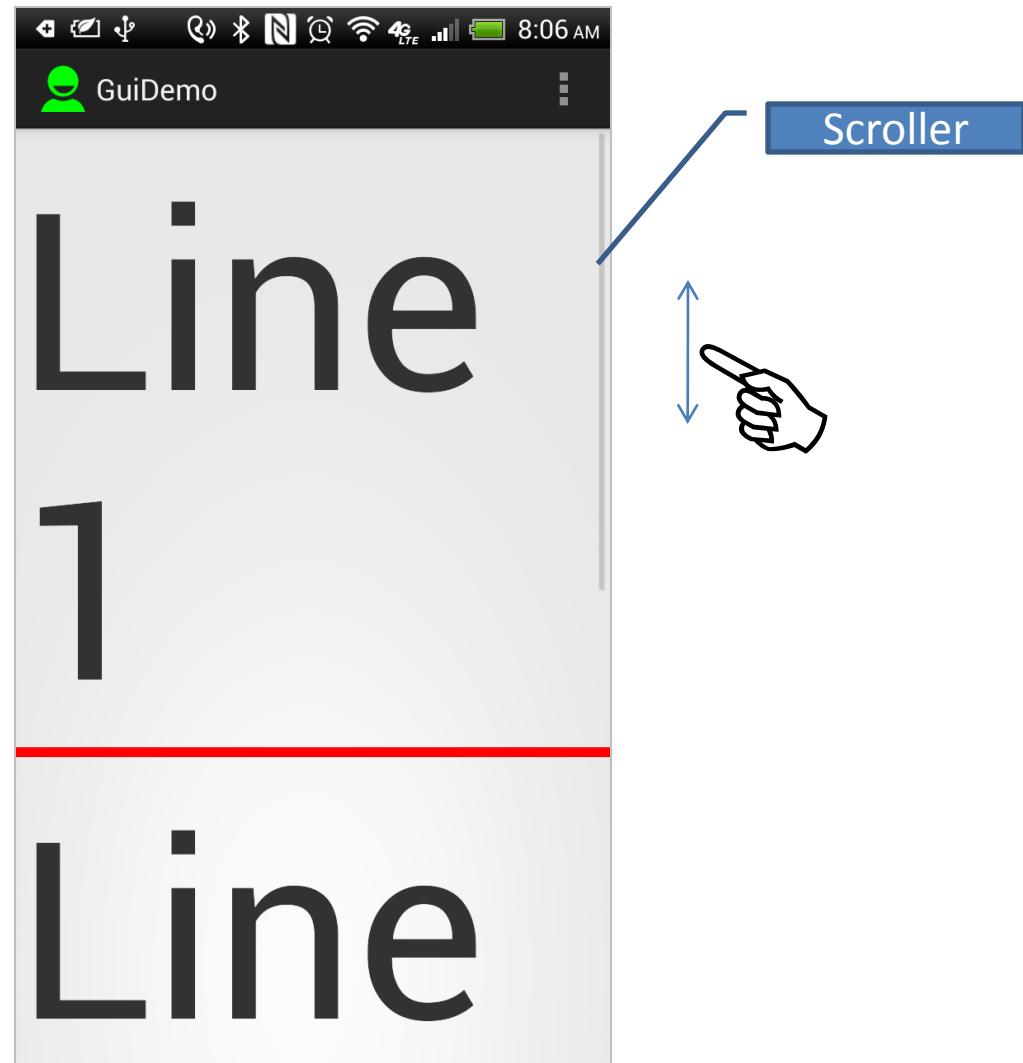

TODO: try to stretch one column at the time 1, then 2, and so on.

Basic XML Layouts - Containers

4. ScrollView Layout

- The **ScrollView** control is useful in situations in which we have *more data to show* than what a single screen could display.
- ScrollViews provide a sliding access to the data.
- Only a portion of the user's data can be seen at one time, however the rest is available via scrolling.

Basic XML Layouts - Containers

4. Example: ScrollView Layout

```
<?xml version="1.0" encoding="utf-8"?>

<ScrollView
    xmlns:android="http://schemas.android.com/apk/res/android"
    android:id="@+id/myScrollView1"
    android:layout_width="match_parent"
    android:layout_height="match_parent" >

    <LinearLayout
        android:id="@+id/myLinearLayoutVertical"
        android:layout_width="match_parent"
        android:layout_height="match_parent"
        android:orientation="vertical" >

        <TextView
            android:id="@+id/textView1"
            android:layout_width="match_parent"
            android:layout_height="wrap_content"
            android:text="Line1"
            android:textSize="150dp" />

        <View
            android:layout_width="match_parent"
            android:layout_height="6dp"
            android:background="#ffff0000" />

        <TextView
            android:id="@+id/textView2"
            android:layout_width="match_parent"
            android:layout_height="wrap_content"
            android:text="Line2"
            android:textSize="150dp" />

        <View
            android:layout_width="match_parent"
            android:layout_height="6dp"
            android:background="#ffff0000" />

        <TextView
            android:id="@+id/textView3"
            android:layout_width="match_parent"
            android:layout_height="wrap_content"
            android:text="Line3"
            android:textSize="150dp" />

    </LinearLayout>
</ScrollView>
```

Basic XML Layouts - Containers

5. Miscellaneous. Absolute Layout

- A layout that lets you specify exact locations (x/y coordinates) of its children.
- Absolute layouts are *less flexible* and harder to maintain than other types of layouts without absolute positioning.

Basic XML Layouts - Containers

5. Miscellaneous Absolute Layout (cont.)

```
<?xml version="1.0" encoding="utf-8"?>
<AbsoluteLayout
    android:id="@+id/myLinearLayout"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:background="#ff0033cc"
    android:padding="4dp"
    xmlns:android="http://schemas.android.com/apk/res/android"
>

<TextView
    android:id="@+id/tvUser"
    android:layout_width="match_parent"
    android:layout_height="wrap_content"
    android:background="#ffff0066"
    android:text="User Name"
    android:textSize="16sp"
    android:textStyle="bold"
    android:textColor="#ff000000"
    android:layout_x="0dp"
    android:layout_y="10dp"
>
</TextView>
<EditText
    android:id="@+id/etName"
    android:layout_width="match_parent"
    android:layout_height="wrap_content"
    android:textSize="18sp"
    android:layout_x="0dp"
    android:layout_y="38dp"
>
</EditText>
<Button
    android:layout_width="120dp"
    android:text="Go"
    android:layout_height="wrap_content"
    android:textStyle="bold"
    android:id="@+id	btnGo"
    android:layout_x="100dp"
    android:layout_y="170dp" />
</AbsoluteLayout>
```

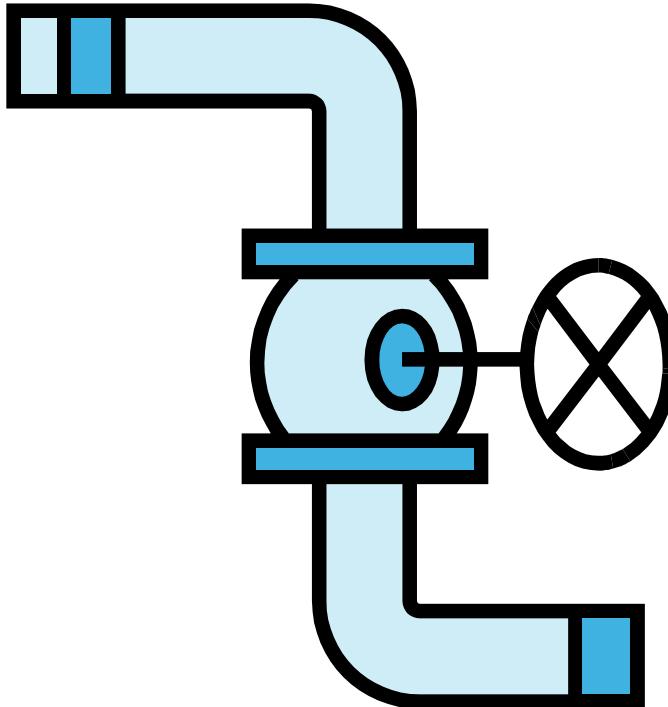

Attaching Layouts to Java Code

PLUMBING. You must ‘connect’ the XML elements with equivalent objects in your Java activity. This allows you to manipulate the UI with code.

XML Layout

```
<xml....  
...  
...  
</xml>
```

JAVA code

```
public class ....  
{  
...  
...  
}
```

Attaching Layouts to Java Code

Assume the UI in *res/layout/main.xml* has been created. This layout could be called by an application using the statement

```
setContentView(R.layout.main);
```

Individual widgets, such as *myButton* could be accessed by the application using the statement `findViewById(...)` as in

```
Button btn= (Button) findViewById(R.id.myButton);
```

Where **R** is a class automatically generated to keep track of resources available to the application. In particular **R.id...** is the collection of widgets defined in the XML layout.

Attaching Layouts to Java Code

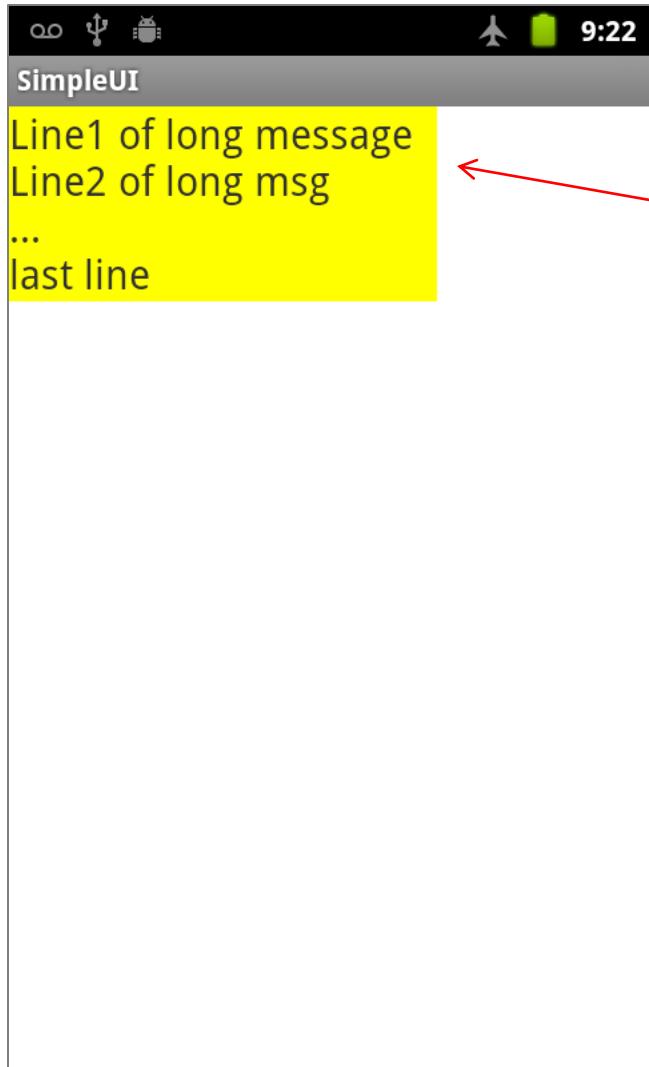

Attaching Listeners to the Widgets

The button of our example could now be used, for instance a listener for the click event could be written as:

```
btn.setOnClickListener(new OnClickListener() {  
    @Override  
    → public void onClick(View v) {  
        updateTime();  
    }  
} );  
  
private void updateTime() {  
    btn.setText(new Date().toString());  
}
```

Basic Widgets: Labels

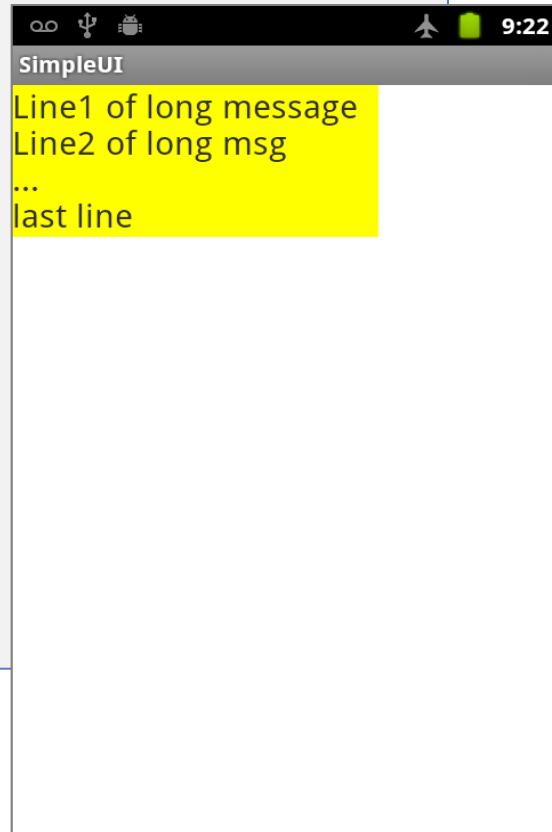

- A **label** is called in android a **TextView**.
- TextViews are typically used for output to display a caption.
- TextViews are *not* editable, therefore they take no input.

Basic Widgets: Labels

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:id="@+id/widget32"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:orientation="vertical" >

    <TextView
        android:id="@+id/txt1"
        android:layout_width="wrap_content"
        android:layout_height="wrap_content"
        android:background="#fffff00"
        android:inputType="none"
        android:text="@string/Long_msg_1"
        android:textSize="20sp" />

</LinearLayout>
```

Hint on Better Programming Style:

Add to the **res/values/stringg.xml** the entry

```
<string name="long_msg_1">Line1 of long message\nLine2 of long msg\n...\nlast line</string>
```

EditText Caution

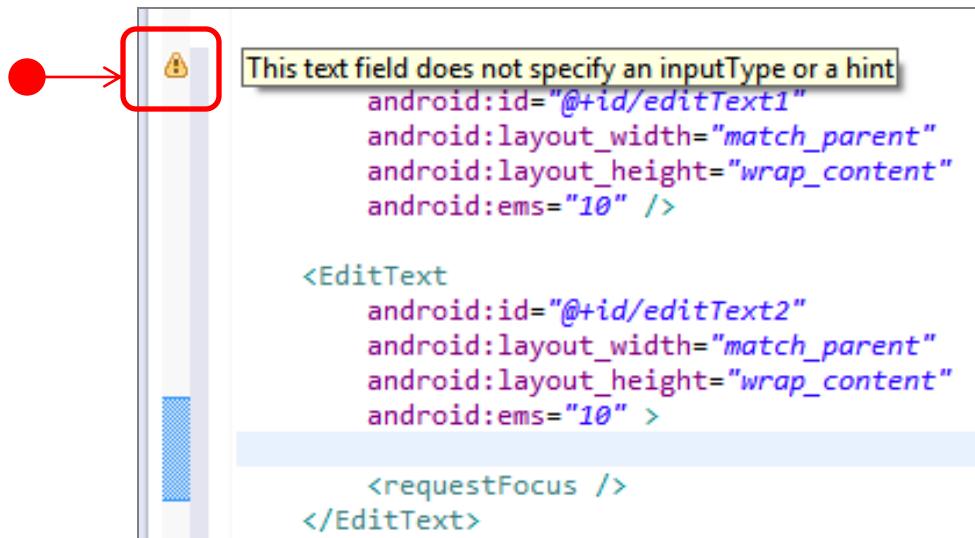

WARNING

This text field does not specify an
InputType or a hint

is just a warning requesting your help to improve
the working of a TextView. Add the clause

android:hint="...some hint here..." and/or
android:InputType="...choice..." where
choices are

```
    This text field does not specify an inputType or a hint
    android:id="@+id/editText1"
    android:layout_width="match_parent"
    android:layout_height="wrap_content"
    android:ems="10" />

    <EditText
        android:id="@+id/editText2"
        android:layout_width="match_parent"
        android:layout_height="wrap_content"
        android:ems="10" >

        <requestFocus />
    </EditText>
```

- Ⓐ "none"
- Ⓐ "text"
- Ⓐ "textCapCharacters"
- Ⓐ "textCapWords"
- Ⓐ "textCapSentences"
- Ⓐ "textAutoCorrect"
- Ⓐ "textAutoComplete"
- Ⓐ "textMultiLine"
- Ⓐ "textImeMultiLine"
- Ⓐ "textNoSuggestions"
- Ⓐ "textUri"
- Ⓐ "textEmailAddress"
- Ⓐ "textEmailSubject"
- Ⓐ "textShortMessage"
- Ⓐ "textLongMessage"
- Ⓐ "textPersonName"
- Ⓐ "textPostalAddress"
- Ⓐ "textPassword"
- Ⓐ "textVisiblePassword"
- Ⓐ "textWebEditText"
- Ⓐ "textFilter"
- Ⓐ "textPhonetic"
- Ⓐ "number"
- Ⓐ "numberSigned"
- Ⓐ "numberDecimal"
- Ⓐ "phone"
- Ⓐ "datetime"
- Ⓐ "date"
- Ⓐ "time"

Basic Widgets: Buttons

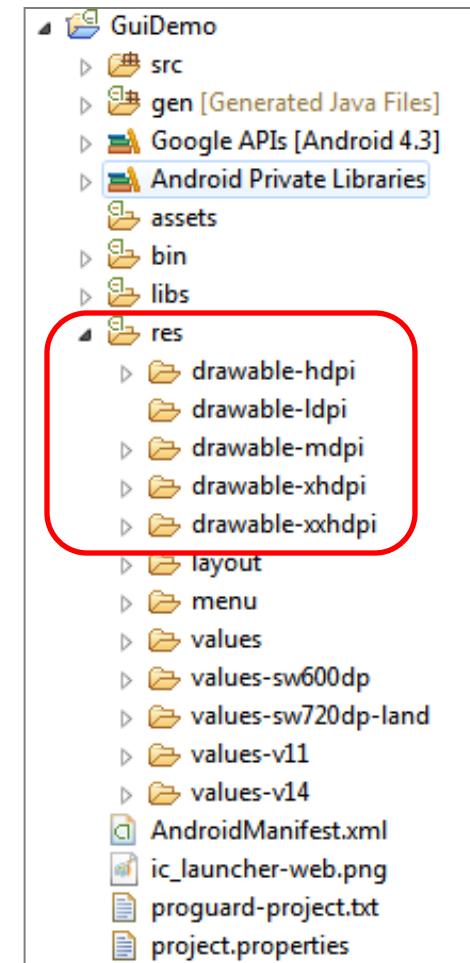

- A **Button** widget allows the simulation of a clicking action on a GUI.
- **Button** is a subclass of **TextView**. Therefore formatting a button's face is similar to the setting of a **TextView**.

```
<Button  
    android:id="@+id/button1"  
    android:layout_width="300dp"  
    android:layout_height="wrap_content"  
    android:layout_gravity="center"  
    android:layout_marginTop="5dp"  
    android:gravity="right"  
    android:padding="5dp"  
    android:text="@string/button1_caption"  
    android:textColor="#ffff0000"  
    android:textSize="20sp"  
    android:textStyle="bold" />
```

Basic Widgets: Images

- **ImageView** and **ImageButton** are two Android widgets that allow embedding of images in your applications.
- Analogue to *TextView* and *Button* controls (respectively).
- Each widget takes an **android:src** or **android:background** attribute (in an XML layout) to specify what picture to use.
- Pictures are usually stored in the **res/drawable** folder (optionally a low, medium, and high definition version of the same image could be stored to later be used with different types of screens)

Basic Widgets: Images

```
<LinearLayout  
    . . .  
  
    <ImageButton  
        android:id="@+id/myImageBtn1"  
        android:layout_width="wrap_content"  
        android:layout_height="wrap_content"  
        android:src="@drawable/ic_launcher" >  
    </ImageButton>  
  
    <ImageView  
        android:id="@+id/myImageView1"  
        android:layout_width="150dp"  
        android:layout_height="120dp"  
        android:scaleType="fitXY"  
        android:src="@drawable/flower1" >  
    </ImageView>  
  
</LinearLayout>
```

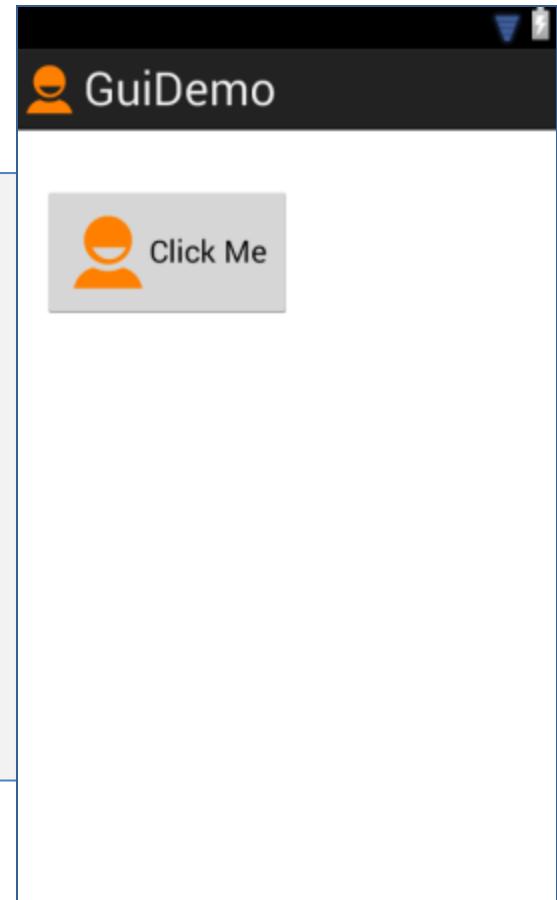

This is a jpg,
gif, png,... file

Basic Widgets: Combining Images & Text

A common **Button** could display text and a simple image as shown below

```
<LinearLayout  
    . . .  
  
<Button  
        android:layout_width="wrap_content"  
        android:layout_height="wrap_content"  
        android:drawableLeft="@drawable/ic_happy_face"  
        android:gravity="left/center_vertical"  
        android:padding="15dp"  
        android:text="@string/click_me" />  
  
</LinearLayout>
```

Basic Widgets: Images

Icons are small images used to graphically represent your application and/or parts of it. They may appear in different places of the device including:

- Home screen
- Launcher window.
- Options menu
- Action Bar
- Status bar
- Multi-tab interface.
- Pop-up dialog boxes
- List view

Detailed information at:

http://developer.android.com/guide/practices/ui_guidelines/icon_design.html

HINT

Several websites allow you to convert your pictures to image files under a variety of formats & sizes (.png, .jpg, .gif, etc). For instance try:

<http://www.prodraw.net/favicon/index.php>

<http://converticon.com/>

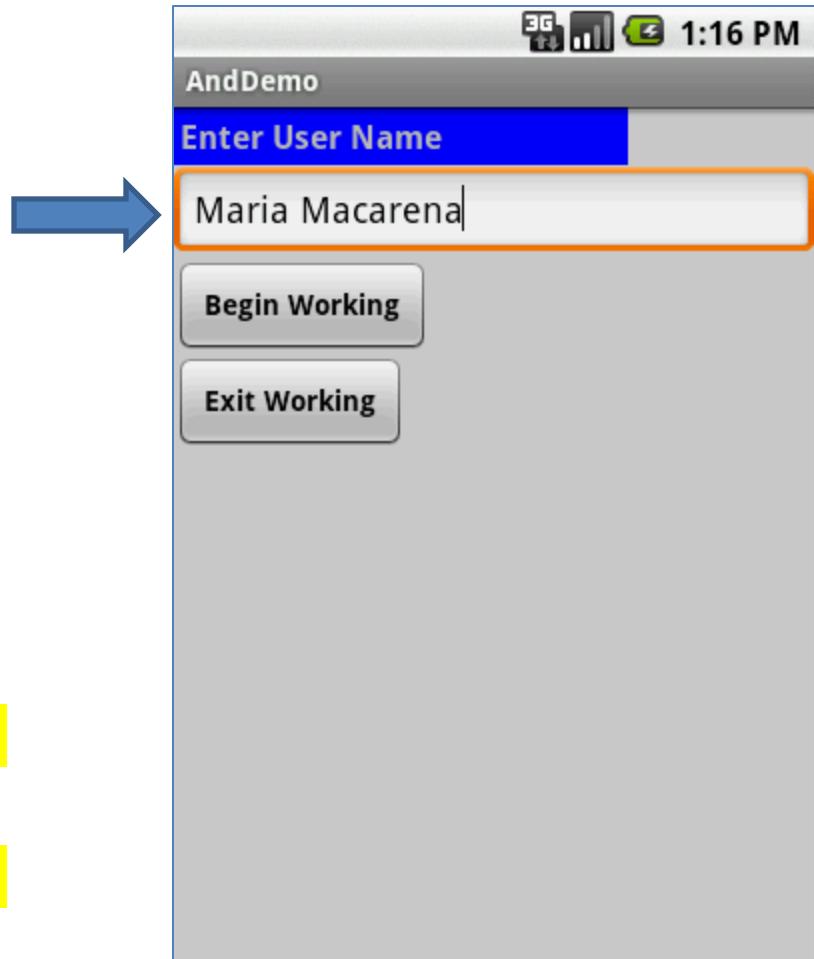

Basic Widgets: EditText

- The **EditText** (or *textBox*) widget is an extension of *TextView* that allows user's input.
- The control can display *editable* text (uses HTML-styles: bold, ...).
- Important Java methods are:

```
txtBox.setText("someValue")
```

and

```
txtBox.getText().toString()
```

Basic Widgets: EditText

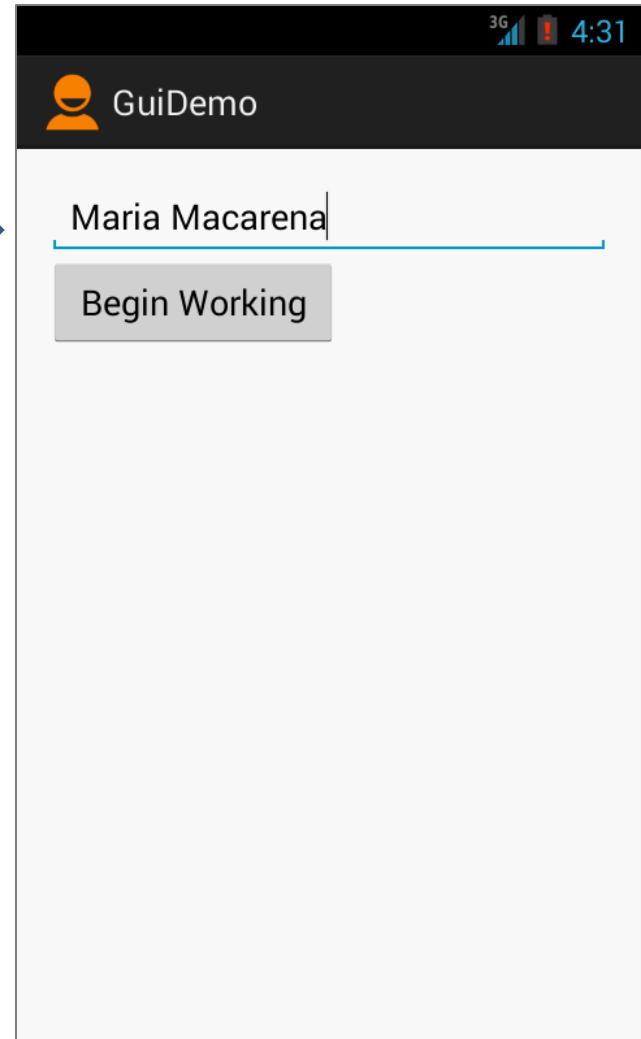

- The **EditText** (or *textBox*) widget is an extension of *TextView* that allows user's input.
- Important Java I/O methods are:

`txtBox.setText("someValue")`

and

`txtBox.getText().toString()`

- The control can display *editable* or *HTML-formatted* text by means of `Html.fromHtml(text)`

Basic Widgets: EditText

CAUTION: Deprecated Methods

- DEPRECATED**
- android:autoText
 - android:capitalize
 - android:digits
 - android:singleLine
 - android:password
 - android:numeric
 - android:phonenumber

Instead use the newer attribute:

android:inputType="...choices..."

where choices include

④ "none"
④ "text"
④ "textCapCharacters"
④ "textCapWords"
④ "textCapSentences"
④ "textAutoCorrect"
④ "textAutoComplete"
④ "textMultiLine"
④ "textImeMultiLine"
④ "textNoSuggestions"
④ "textUri"
④ "textEmailAddress"
④ "textEmailSubject"
④ "textShortMessage"
④ "textLongMessage"
④ "textPersonName"
④ "textPostalAddress"
④ "textPassword"
④ "textVisiblePassword"
④ "textWebEditText"
④ "textFilter"
④ "textPhonetic"
④ "number"
④ "numberSigned"
④ "numberDecimal"
④ "phone"
④ "datetime"
④ "date"
④ "time"

Basic Widgets: EditViews

Example

```
...  
  
<EditText  
    android:id="@+id/txtUserName"  
    android:layout_width="match_parent"  
    android:layout_height="wrap_content"  
  
    android:inputType="textCapWords/textAutoCorrect"  
  
    android:hint="@string/enter_your_first_and_last_name"  
  
    android:textSize="18sp" />  
  
...
```

Enter "teh" It will
be changed to: "the"

Each word is
capitalized

Suggestion (grey out)

Example 1: Login Screen

In this example we will create and use a simple login screen holding a label(**TexView**), a textBox (EditText), and a **Button**. A fragment of its functionality is shown below.

Example 1: Login Screen

Layout Design 1 of 2

```
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:background="#886495ed"
    android:orientation="vertical"
    android:padding="2dp" >

    <TextView
        android:id="@+id/textView1"
        android:layout_width="match_parent"
        android:layout_height="wrap_content"
        android:layout_marginTop="1dp"
        android:background="#fffffff00"
        android:text="@string/ACME_Corp_Caption" />

    <EditText
        android:id="@+id/txtUserName"
        android:layout_width="match_parent"
        android:layout_height="wrap_content"
        android:layout_marginTop="1dp"
        android:hint="@string/Enter_your_First_and_Last_name"
        android:inputType="textCapWords/textAutoCorrect"
        android:textSize="18sp" >

        <requestFocus />
    </EditText>
```

Example 1: Login Screen

Layout Design 2 of 2

```
<Button  
    android:id="@+id/button1"  
    android:layout_width="82dp"  
    android:layout_height="wrap_content"  
    android:layout_marginTop="1dp"  
    android:text="@string/Login" />  
  
</LinearLayout>
```

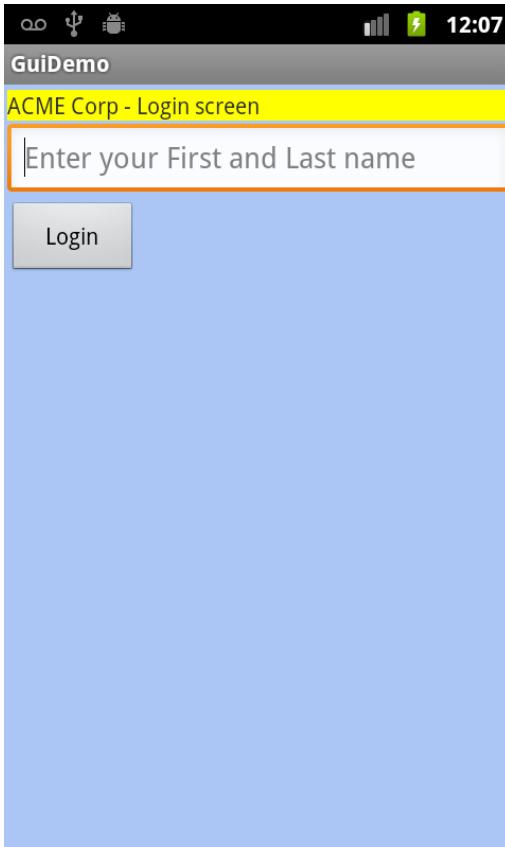

Resource Captions: res/values/strings

```
<?xml version="1.0" encoding="utf-8"?>  
<!-- this is the res/values/strings.xml file -->  
<resources>  
  
    <string name="app_name">GuiDemo</string>  
    <string name="action_settings">Settings</string>  
    <string name="Login">Login</string>  
    <string name="ACME_Corp_Caption">Login</string>  
    <string name="Enter_your_First_and_Last_name">Enter your First and Last name</string>  
  
</resources>
```

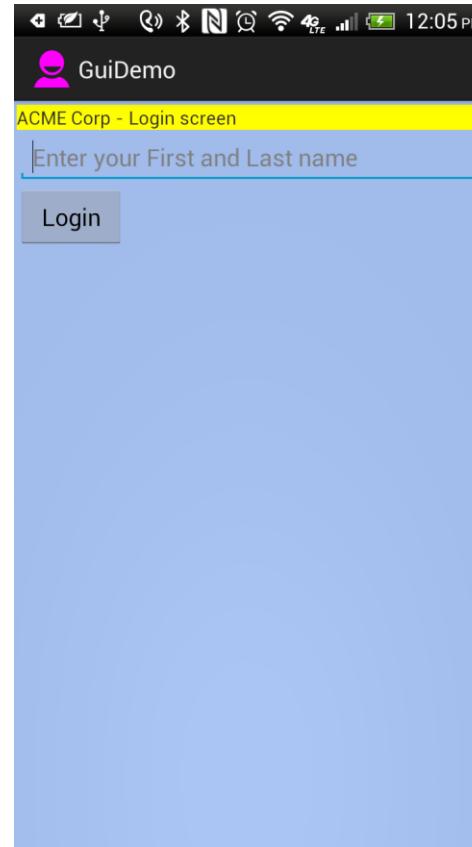

Example 1: Login Screen

Rendering the Layout

The images below show the previously defined login screen displayed by two different devices running SDK2.3 (Gingerbread) and SDK4.3 (Ice Cream)

GingerBread SDK

Ice Cream SDK

Example 1: Login Screen

MainActivity.java Class (1 of 2)

```
package csu.matos.guidemo;
import ...
// "LOGIN" - a gentle introduction to UI controls

public class MainActivity extends Activity {

    //class variables representing UI controls to be controlled from the program
    TextView labelUserName;
    EditText txtUserName;
    Button btnBegin;

    //variables used with the Toast message class
    private Context context;
    private int duration = Toast.LENGTH_SHORT;

    @Override
    public void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        //show the login screen
        setContentView(R.layout.activity_main);
        context = getApplicationContext();
```

Example 1: Login Screen

MainActivity.java Class (2 of 2)

```
//binding the UI's controls defined in "main.xml" to Java code
labelUserName = (TextView) findViewById(R.id.textView1);
txtUserName = (EditText) findViewById(R.id.txtUserName);
btnBegin = (Button) findViewById(R.id.button1);

//LISTENER: allowing the button widget to react to user interaction
btnBegin.setOnClickListener(new OnClickListener() {
    @Override
    public void onClick(View v) {
        String userName = txtUserName.getText().toString();
        if (userName.compareTo("Maria Macarena")==0){
            labelUserName.setText("OK, please wait...");
            Toast.makeText(context,
                "Bienvenido " + userName,
                duration).show();
        }
        Toast.makeText(context,
            userName + " is not a valid USER" ,
            duration).show();
    }
}); // onClick

} //onCreate

}//class
```

Your turn!

Implement any/all of the following projects
Using simple text boxes (EditText, TextView)
and buttons:

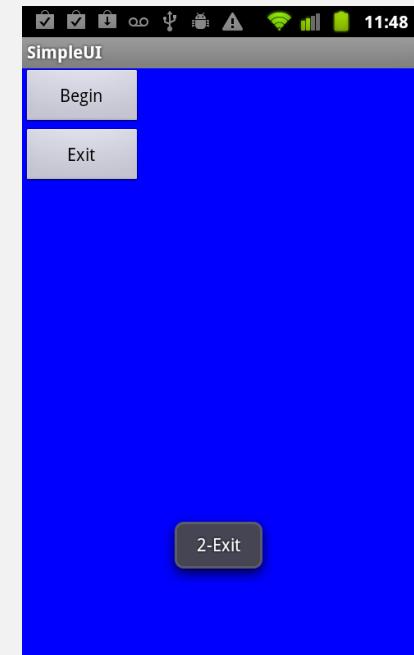

1. Currency calculator
2. Tip Calculator
3. Simple Flashlight

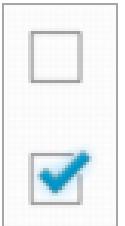

Example 2: Wiring Multiple Button Widgets

Note: The example below shows an alternative way of defining a single Listener for multiple buttons.

```
public class SimpleUI extends Activity implements OnClickListener {  
    Button btnBegin;  
    Button btnExit;  
    @Override  
    public void onCreate(Bundle savedInstanceState) {  
        super.onCreate(savedInstanceState);  
        setContentView(R.layout.main);  
  
        btnBegin = (Button) findViewById(R.id.btnBegin);  
        btnExit = (Button) findViewById(R.id.btnExit);  
  
        btnBegin.setOnClickListener(this);  
        btnExit.setOnClickListener(this);  
    }//onCreate  
  
    @Override  
    public void onClick(View v) {  
        if (v.getId()==btnBegin.getId() ){  
            Toast.makeText(getApplicationContext(), "1-Begin", 1).show();  
        }  
        if (v.getId()==btnExit.getId() ){  
            Toast.makeText(getApplicationContext(), "2-Exit", 1).show();  
        }  
    }//onClick  
}//class
```

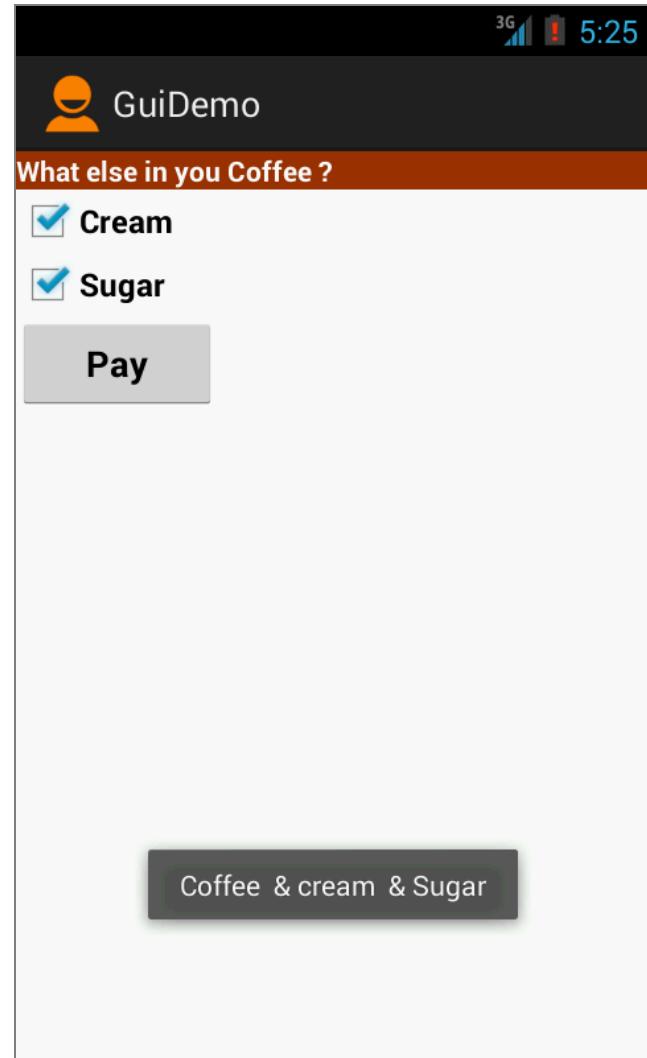

Basic Widgets: CheckBox

A checkbox is a special two-states button that can be either *checked* or *unchecked*.

The screen displays two CheckBox controls for selecting ‘Cream’ and ‘Sugar’ options. In this image both boxes are ‘checked’.

When the user pushes the ‘Pay’ button a Toast-message is issued telling what is the current combination of choices held by the checkboxes.

Example 3: CheckBox

The following Coffee-App shows us how to use Check Boxes.

Layout 1 of 2

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:padding="5dp"
    android:orientation="vertical" >

    <TextView
        android:id="@+id/LabelCoffee"
        android:layout_width="match_parent"
        android:layout_height="wrap_content"
        android:background="#ff993300"
        android:text="@string/coffee_addons"
        android:textColor="@android:color/white"
        android:textStyle="bold" />

    <CheckBox
        android:id="@+id/chkCream"
        android:layout_width="wrap_content"
        android:layout_height="wrap_content"
        android:text="@string/cream"
        android:textStyle="bold" />
```

Example 3: CheckBox

Coffee-App

Layout 2 of 2

```
<CheckBox  
    android:id="@+id/chkSugar"  
    android:layout_width="wrap_content"  
    android:layout_height="wrap_content"  
    android:text="@string/sugar"  
    android:textStyle="bold" />  
  
<Button  
    android:id="@+id/btnPay"  
    android:layout_width="153dp"  
    android:layout_height="wrap_content"  
    android:text="@string/pay"  
    android:textStyle="bold" />  
  
</LinearLayout>
```

Example 3: CheckBox

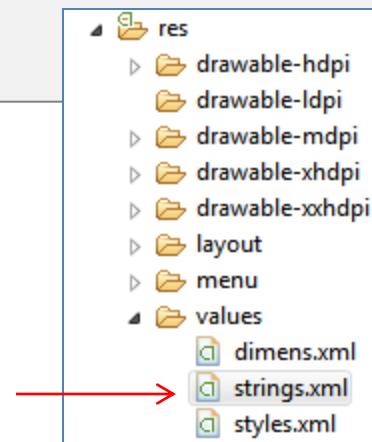

Coffee-App

Resources: res/values/strings

```
<?xml version="1.0" encoding="utf-8"?>
<resources>

    <string name="app_name">GuiDemo</string>
    <string name="action_settings">Settings</string>

    <string name="click_me">Click Me</string>
    <string name="sugar">Sugar</string>
    <string name="cream">Cream</string>
    <string name="coffee_addons">What else do you like in your coffee?</string>
    <string name="pay">Pay</string>
</resources>
```

Example 2: CheckBox

Java Code – 1 of 2

```
public class MainActivity extends Activity {  
    CheckBox chkCream;  
    CheckBox chkSugar;  
    Button btnPay;  
  
    @Override  
    public void onCreate(Bundle savedInstanceState) {  
        super.onCreate(savedInstanceState);  
        setContentView(R.layout.activity_main);  
  
        //binding XML controls with Java code  
        chkCream = (CheckBox)findViewById(R.id.chkCream);  
        chkSugar = (CheckBox)findViewById(R.id.chkSugar);  
        btnPay = (Button) findViewById(R.id.btnPay);
```

Example 2: CheckBox

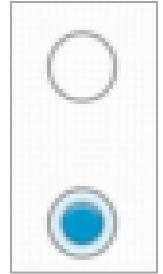

Complete code for the checkBox demo (3 of 3)

```
//LISTENER: wiring button-events-&-code
    btnPay.setOnClickListener(new OnClickListener() {

@Override
public void onClick(View v) {
    String msg = "Coffee ";
    if (chkCream.isChecked()) {
        msg += " & cream ";
    }
    if (chkSugar.isChecked()){
        msg += " & Sugar";
    }
    Toast.makeText(getApplicationContext(),
                       msg, Toast.LENGTH_SHORT).show();
    //go now and compute cost...

} //onClick
}); //onCreate
} //class
```

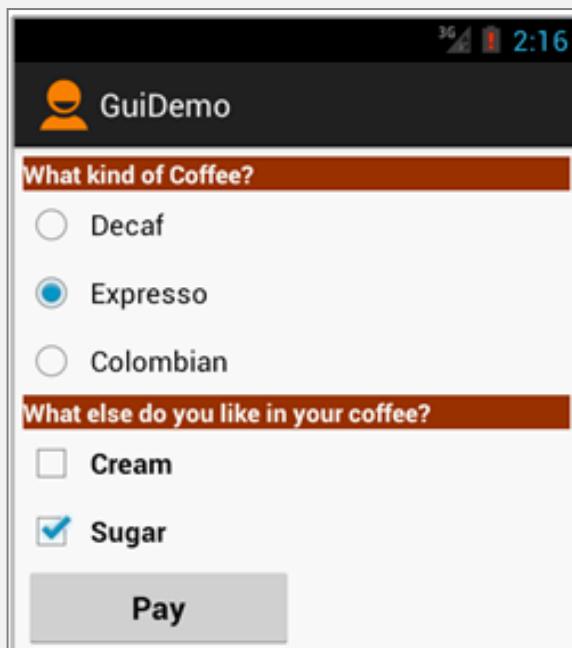

Basic Widgets: RadioButtons

- A radio button is a two-states button that can be either *checked* or *unchecked*.
- When the radio button is unchecked, the user can press or click it to check it.
- Radio buttons are normally used together in a **RadioGroup**.
- When several radio buttons live inside a radio group, checking one radio button *unchecks* all the others.
- RadioButton inherits from ... TextView. Hence, all the standard TextView properties for *font face*, *style*, *color*, etc. are available for controlling the look of radio buttons.
- Similarly, you can call ***isChecked()*** on a RadioButton to see if it is selected, ***toggle()*** to select it, and so on, like you can with a CheckBox.

Example 4: RadioButtons

We extend the previous example by adding a *RadioGroup* and three *RadioButtons*. Only new XML and Java code is shown:

```
<TextView  
    android:id="@+id/textView1"  
    android:layout_width="match_parent"  
    android:layout_height="wrap_content"  
    android:background="#ff993300"  
    android:text="@string/kind_of_coffee"  
    android:textColor="#ffffffff"  
    android:textStyle="bold" />
```

```
<RadioGroup  
    android:id="@+id/radioGroupCoffeeType"  
    android:layout_width="match_parent"  
    android:layout_height="wrap_content" >  
  
<RadioButton  
    android:id="@+id/radDecaf"  
    android:layout_width="wrap_content"  
    android:layout_height="wrap_content"  
    android:text="@string/decaf" />  
  
→ <RadioButton  
    android:id="@+id/radExpresso"  
    android:layout_width="wrap_content"  
    android:layout_height="wrap_content"  
    android:text="@string/expresso" />  
  
<RadioButton  
    android:id="@+id/radColombian"  
    android:layout_width="wrap_content"  
    android:layout_height="wrap_content"  
    android:checked="true"  
    android:text="@string/colombian" />  
/>RadioGroup>
```

Example 4: RadioButtons

```
public class MainActivity extends Activity {  
    CheckBox chkCream; ←  
    CheckBox chkSugar;  
    Button btnPay;  
  
    RadioGroup radCoffeeType; ←  
    RadioButton radDecaf;  
    RadioButton radExpresso;  
    RadioButton radColombian;  
  
    @Override  
    public void onCreate(Bundle savedInstanceState) {  
        super.onCreate(savedInstanceState);  
        setContentView(R.layout.main);  
        chkCream = (CheckBox) findViewById(R.id.chkCream);  
        chkSugar = (CheckBox) findViewById(R.id.chkSugar);  
        btnPay = (Button) findViewById(R.id.btnPay);  
  
        radCoffeeType = (RadioGroup) findViewById(R.id.radioGroupCoffeeType);  
        radDecaf = (RadioButton) findViewById(R.id.radDecaf);  
        radExpresso = (RadioButton) findViewById(R.id.radExpresso);  
        radColombian = (RadioButton) findViewById(R.id.radColombian);  
    }  
}
```

Example 4: RadioButtons

```
// LISTENER: wiring button-events-&-code
btnPay.setOnClickListener(new OnClickListener() {
    @Override
    public void onClick(View v) {
        String msg = "Coffee ";
        if (chkCream.isChecked())
            msg += " & cream ";
        if (chkSugar.isChecked())
            msg += " & Sugar";

        // get radio buttons ID number
        int radioId = radCoffeeType.getCheckedRadioButtonId();

        // compare selected's Id with individual RadioButtons ID
        if (radColombian.getId() == radioId)
            msg = "Colombian " + msg;
        // similarly you may use .isChecked() on each RadioButton
        if (radExpresso.isChecked())
            msg = "Expresso " + msg;
        // similarly you may use .isChecked() on each RadioButton
        if (radDecaf.isChecked())
            msg = "Decaf " + msg;

        Toast.makeText(getApplicationContext(), msg, 1).show();
        // go now and compute cost...
    } // onClick
});
} // onCreate
} // class
```

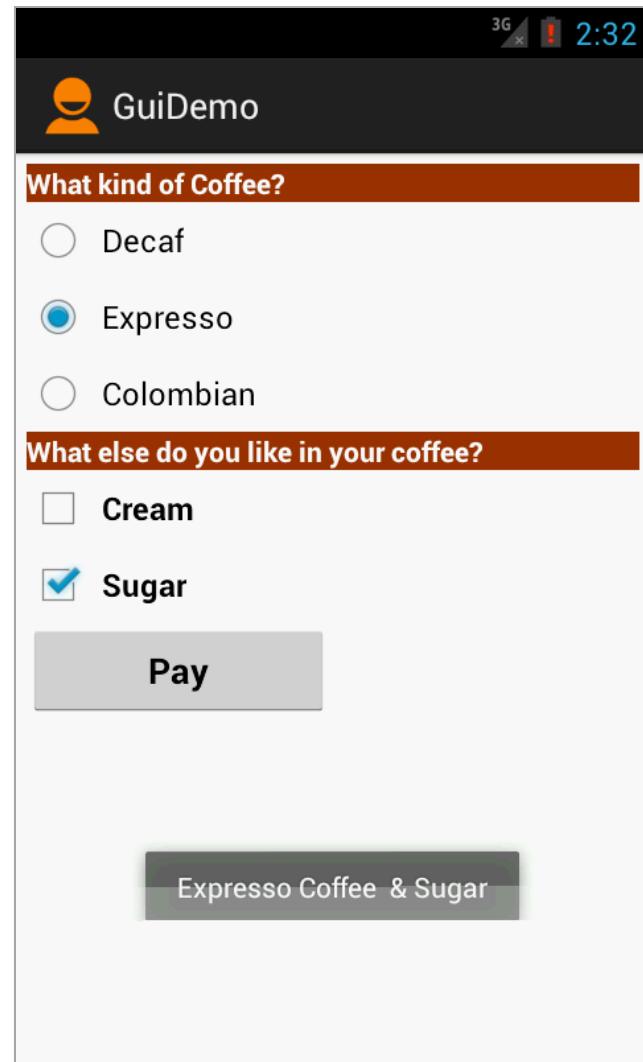

Example 4: RadioButtons

Example

This UI uses
RadioButtons
and
Checkboxes
to define choices

RadioGroup

Summary of choices

Miscellaneous: UI Attributes & Java Methods

XML Controls the focus sequence:

`android:visibility`
 `qndroid:background`
 `<requestFocus />`

Java methods

`myButton.requestFocus()`
 `myTextBox.isFocused()`
 `myWidget.setEnabled()`
 `myWidget.isEnabled()`

User Interfaces

This image was made using the Device Frame Generator, which is part of the Android Asset Studio tool

Appendix A. DroidDraw

A simple GUI generator - **LINK:** www.droidDraw.org

The screenshot shows the DroidDraw application interface. On the left, there is a preview window displaying a mobile screen with a title bar "ABC Droid Corporation of Ohio", a "Button" button, and an "EditText" field. Above the preview, the "Root Layout" is set to "LinearLayout" and the "Screen Size" is "HVGA Portrait". The main workspace on the right contains a toolbar with tabs for "Widgets", "Layouts", "Properties", "Strings", "Colors", "Arrays", and "Support". The "Properties" tab is active, showing settings for an "EditText" widget. The properties include "Id" (@+id/widget34), "Width" (wrap_content), "Height" (wrap_content), and "Background Color" (a color swatch). An "Apply" button is at the bottom of this panel. Below the properties panel is an "Output" panel containing the generated XML code:

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout
    android:id="@+id/widget28"
    android:layout_width="fill_parent"
    android:layout_height="fill_parent"
    android:background="#ff009999"
    android:orientation="vertical"
    xmlns:android="http://schemas.android.com/apk/res/android"
>
<TextView
    android:id="@+id/widget29"
    android:layout_width="fill_parent"
    android:layout_height="wrap_content"
    android:text="ABC Droid Corporation of Ohio"
/>
```

Appendix B:

Android Asset Studio

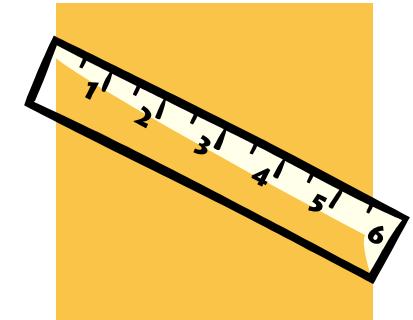

LINK: <http://android-ui-utils.googlecode.com/hg/asset-studio/dist/index.html>

This tool offers to the designers a number of options to craft high-quality apps, among those components it has

Icon Generators	Other Generators	Community Tools
Launcher icons Action bar and tab icons Notification icons Navigation drawer indicator Generic icons	Device frame generator Simple nine-patch gen.	Android Action Bar Style Generator Android Holo Colors Generator

Appendix C: Measuring Graphic Elements

Q. What is dpi (also known as ppi) ?

Stands for *dots per inch*. It suggests a measure of screen quality.

You can compute it using the following formula:

$$dpi = \sqrt{widthPixels^2 + heightPixels^2} / diagonalInches$$

G1 (base device 320x480)	155.92 dpi	(3.7 in diagonally)
Nexus (480x800)	252.15 dpi	
HTC One (1080x1920)	468 dpi	(4.7 in)
Samsung S4 (1080x1920)	441 dpi	(5.5 in)

Q. What is the difference between dp, dip and sp units in Android?

dp (also known as **dip**) *Density-independent Pixels* – is an abstract unit based on the physical density of the screen. These units are relative to a 160 dpi screen, so one dp is one pixel (dp) on a 160 dpi screen. Use it for measuring anything but fonts – DO NOT USE dp, in. mm

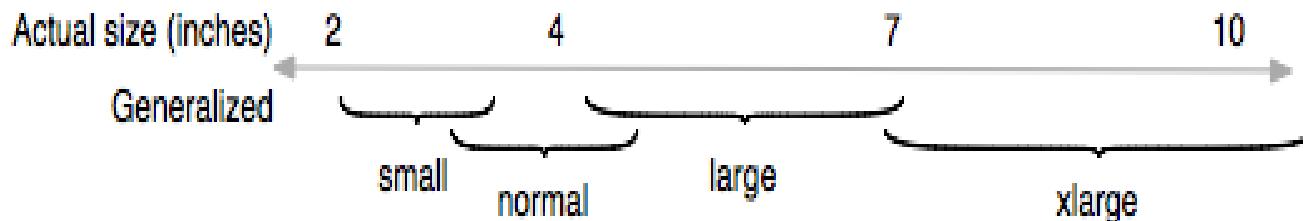

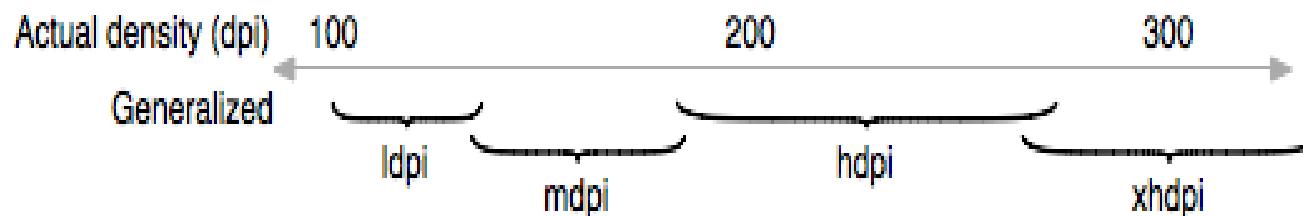

sp

Scale-independent Pixels – similar to the relative density dp unit, but used for font size preference.

Appendix C: Measuring Graphic Elements

Q. How Android deals with screen resolutions?

Illustration of how the Android platform maps actual screen densities and sizes to generalized density and size configurations.

Appendix C: Measuring Graphic Elements

Q. What do I gain by using screen densities?

More homogeneous results as shown below

Examples of density independence on WVGA high density (left), HVGA medium density (center), and QVGA low density (right).

Q. How to set different density/size screens in my application?

The following manifest fragments declares support for small, normal, large, and xlarge screens in any density.

```
<manifest xmlns:android="http://schemas.android.com/apk/res/android"  
    <supports-screens  
        android:anyDensity="true"  
        android:largeScreens="true"  
        android:normalScreens="true"  
        android:smallScreens="true"  
        android:xlargeScreens="true" />  
    ...  
    </manifest>
```

Appendix C: Measuring Graphic Elements

Q. Give me an example on how to use dp units.

Assume you design your interface for a G1 phone having 320x480 pixels (Abstracted LCD density is **160** – See your AVD entry the actual pixeling is a: $2 \times 160 \times 3 \times 160$)

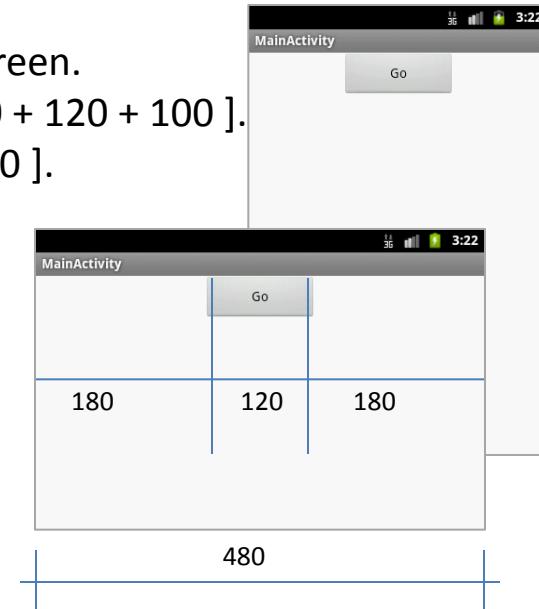

Assume you want a 120dp button to be placed in the middle of the screen.

On portrait mode you could allocate the 320 horizontal pixels as [100 + 120 + 100].

On Landscape mode you could allocate 480 pixels as [180 + 120 + 180].

The XML would be

```
<Button  
    android:id="@+id/button1"  
    android:layout_height="wrap_content"  
    android:layout_width="120dp"  
    android:layout_gravity="center"  
    android:text="@+id/go_caption" />
```

If the application is deployed on devices having a higher resolution the button is still mapped to the middle of the screen.

Appendix D: Hierarchy Viewer Tools

The HierarchyViewer Tool allows exploration of a displayed UI. Use **DDMS > Click on Devices > Click on HierarchyViewer** (next to camera)

The screenshot shows the Android Hierarchy Viewer tool interface. On the left, there is a preview window titled "dump_8448446474296423450.uix" displaying a user interface for a coffee ordering app. The UI includes a title bar with a user icon and the text "GuiDemo". Below this is a list of coffee types: "Decaf", "Expresso", and "Colombian", with "Colombian" being selected. Another section asks "What else do you like in your coffee?" with options "Cream" and "Sugar". A "Pay" button is at the bottom. On the right, the tool displays the XML hierarchy of the UI components:

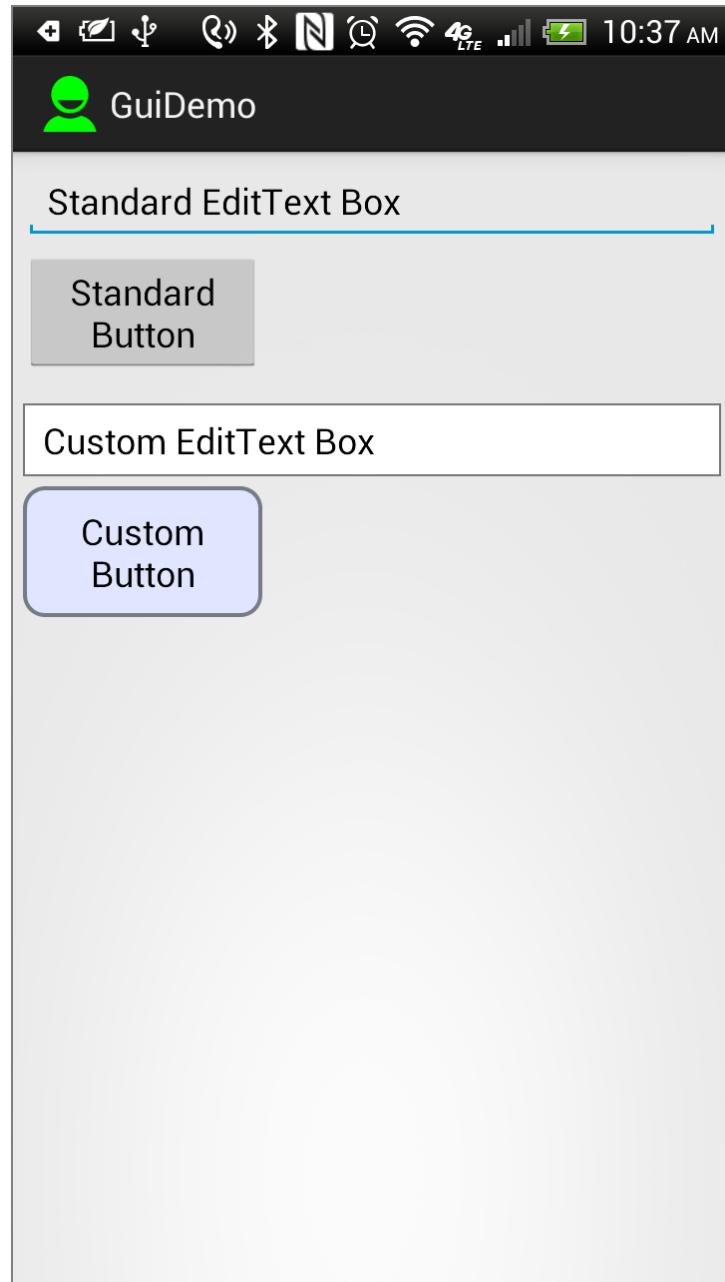

```
0) LinearLayout [97,73][244,122]
  0) TextView: GuiDemo [97,73][244,122]
  1) FrameLayout [0,146][720,1280]
    0) LinearLayout [0,146][720,1280]
      0) TextView: What kind of Coffee? [10,156][710,194]
        1) RadioGroup [10,194][710,425]
          0) RadioButton: Decaf [10,194][170,271]
          1) RadioButton: Expresso [10,271][218,348]
          2) RadioButton: Colombian [10,348][240,425]
        2) TextView: What else do you like in your coffee? [10,425]
        3) CheckBox: Cream [10,463][179,540]
        4) CheckBox: Sugar [10,540][170,617]
        5) Button: Pay [10,617][316,713]
```

Below the hierarchy, a "Node Detail" table provides specific information for the first node:

index	0
text	android.widget.LinearLayout
class	csu.matos.guidemo
content-desc	
checkable	false
checked	false
clickable	false
enabled	true
focusable	false
focused	false

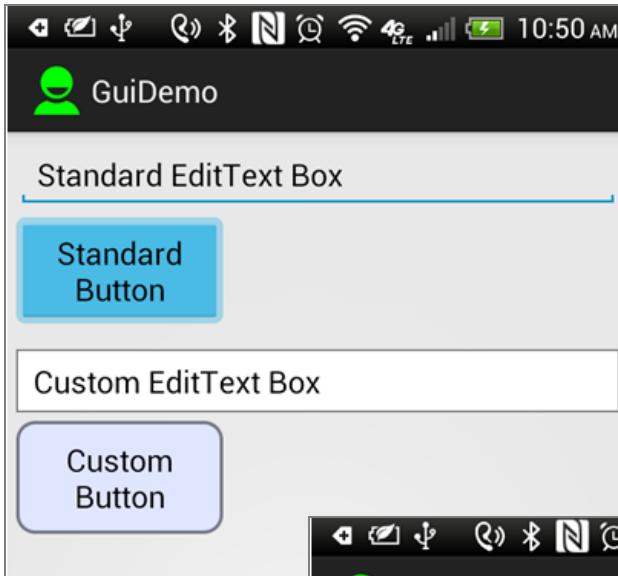

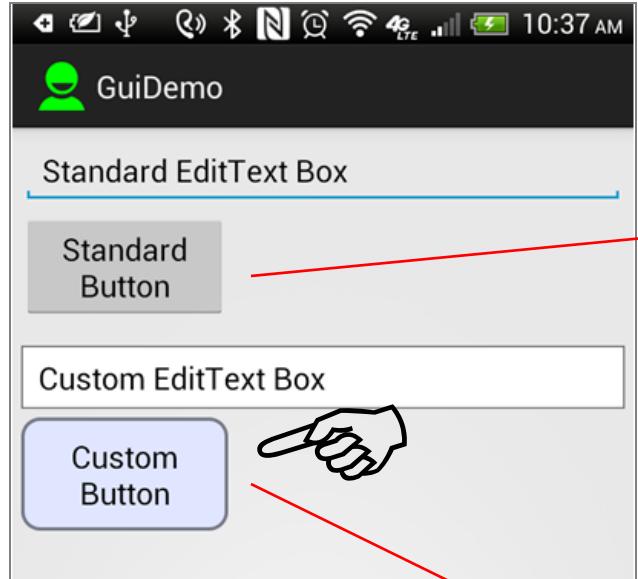

Appendix E: Customizing Widgets

1. The appearance of a widget can be adjusted by the user. For example a button widget could be modified by changing its shape, border, color, margins, etc.
2. Basic shapes include: rectangle, oval, line, and ring.
3. In addition to visual changes, the widget's reaction to user interaction could be adjusted for events such as: Focused, Clicked, etc.
4. The figure shows an EditText and Button widgets as *normally* displayed by a device running SDK4.3 (Ice Cream). The bottom two widgets are custom made versions of those two controls respectively.

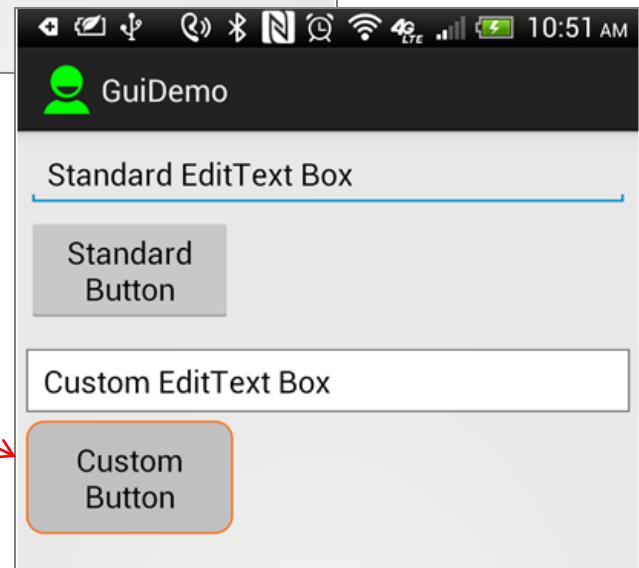

Appendix E: Customizing Widgets

The image shows visual feedback provided to the user during the clicking of a standard and a *custom* Button widget. Assume the device runs under SDK4.3

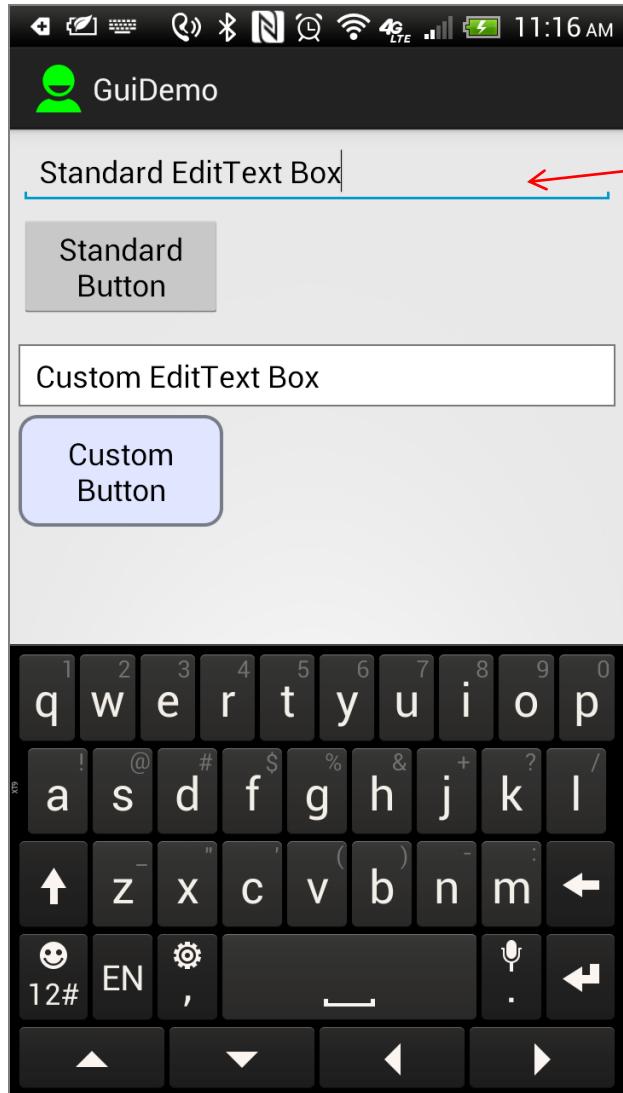

Standard behavior – buttons turns blue when it is pressed.

Custom behavior – buttons turns dark grey with an orange border when it is pressed.

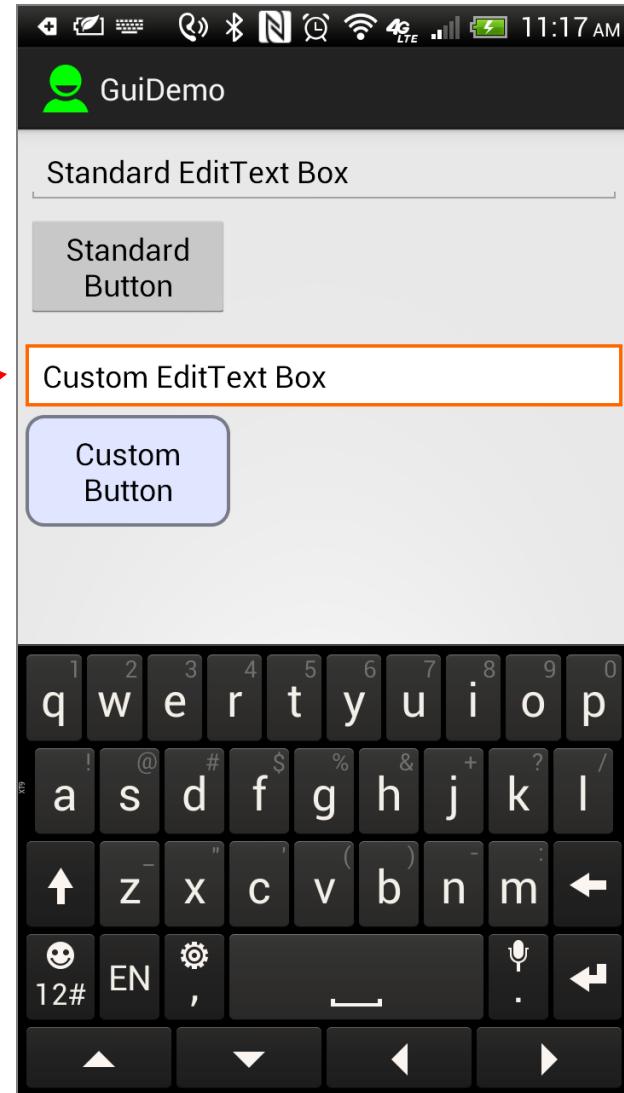

Appendix E: Customizing Widgets

Observe the transient response of the standard and custom made EditText boxes when the user touches the widgets provoking the ‘Focused’ event.

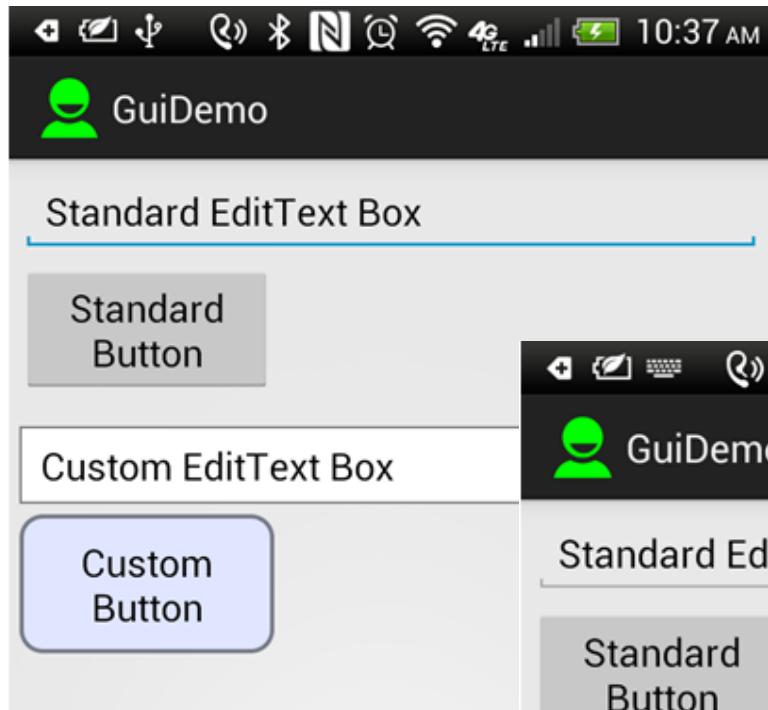

When focused
the standard box
shows a blue
bottom line

A focused
custom box
shows an orange
all-around frame

Appendix E: Customizing Widgets

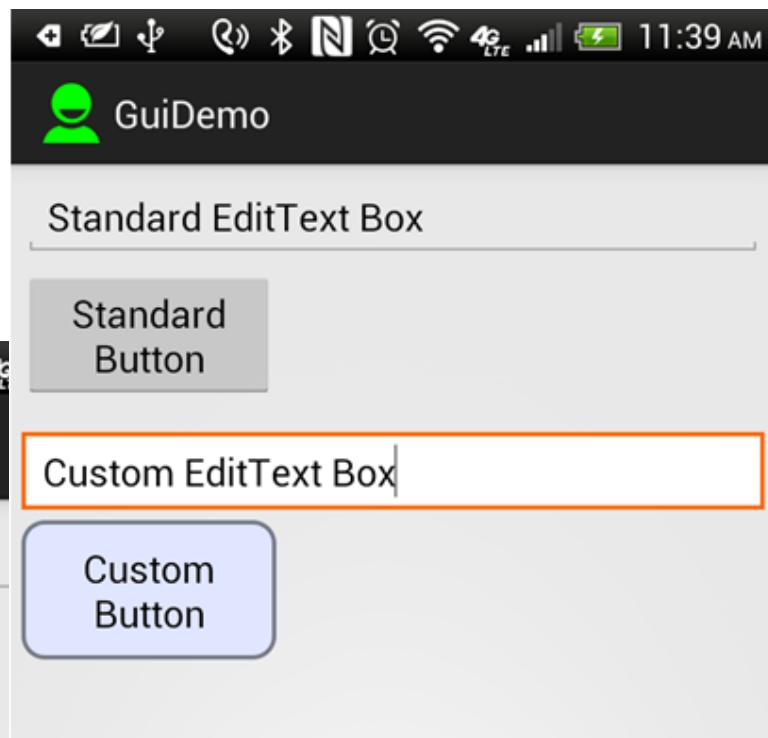

When the user taps on the custom made EditText box a gradient is applied to the box to flash a visual feedback reassuring the user of her selection.

1. Non-focused custom
EditText widget, grey
border

2. Clicked EditText widget
showing a yellow colored
linear gradient and orange
border

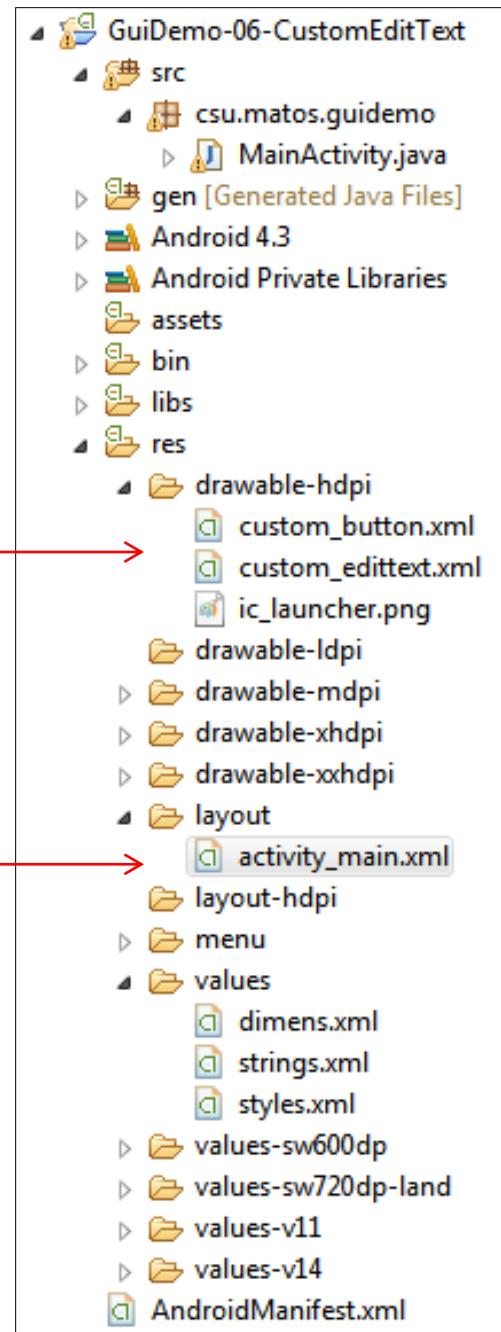

3. Focused custom
EditText widget showing
an orange border

Appendix E: Customizing Widgets

Organizing the application

Definition of the custom templates for
Button and EditText widgets

Layout referencing standard and custom
made widgets

Appendix E: Customizing Widgets

Activity Layout 1 of 2

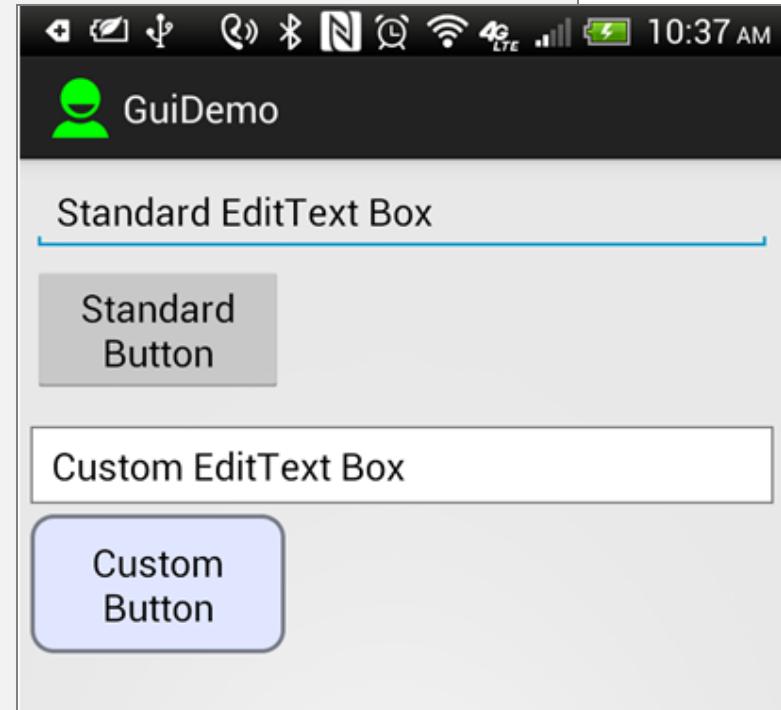

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:orientation="vertical"
    android:padding="5dp" >

    <EditText
        android:id="@+id/editText1"
        android:layout_width="match_parent"
        android:layout_height="wrap_content"
        android:layout_marginBottom="5dp"
        android:ems="10"
        android:inputType="text"
        android:text="@string/standard_edittext" >

        <requestFocus />
    </EditText>

    <Button
        android:id="@+id/button1"
        android:layout_width="120dp"
        android:layout_height="wrap_content"
        android:layout_marginBottom="15dp"
        android:text="@string/standard_button" />

```

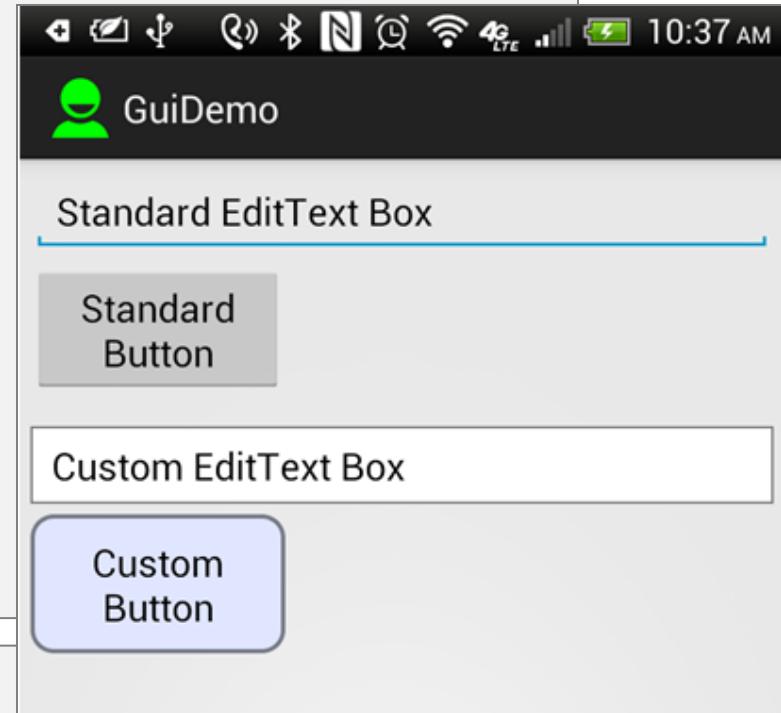

Appendix E: Customizing Widgets

Activity Layout (2 of 2) and Resource: res/values/strings

```
<EditText  
    android:id="@+id/editText2"  
    android:layout_width="match_parent"  
    android:layout_height="wrap_content"  
    android:layout_marginBottom="5dp"  
    android:background="@drawable/custom_edittext"  
    android:ems="10"  
    android:inputType="text"  
    android:text="@string/custom_edittext" />  
  
<Button  
    android:id="@+id/button2"  
    android:layout_width="120dp"  
    android:layout_height="wrap_content"  
    android:background="@drawable/custom_button"  
    android:text="@string/custom_button" />  
  
</LinearLayout>
```

```
<?xml version="1.0" encoding="utf-8"?>  
<resources>  
    <string name="app_name">GuiDemo</string>  
    <string name="action_settings">Settings</string>  
    <string name="standard_button">Standard Button</string>  
    <string name="standard_edittext">Standard EditText Box</string>  
    <string name="custom_button">Custom Button</string>  
    <string name="custom_edittext">Custom EditText Box</string>  
</resources>
```

Appendix E: Customizing Widgets

Resource: res/drawable/custom_button.xml

The custom Button widget has two faces based on the event **state_pressed** (true, false). The Shape attribute specifies its solid color, padding, border (stroke) and corners (rounded corners have radius > 0)

```
<?xml version="1.0" encoding="utf-8"?>
<selector xmlns:android="http://schemas.android.com/apk/res/android" >
    <item android:state_pressed="true">
        <shape android:shape="rectangle">
            <corners android:radius="10dp"/>
            <solid android:color="#ffc0c0c0" />
            <padding android:left="10dp"
                android:top="10dp"
                android:right="10dp"
                android:bottom="10dp"/>
            <stroke android:width="1dp" android:color="#ffFF6600"/>
        </shape>
    </item>
    <item android:state_pressed="false">
        <shape android:shape="rectangle">
            <corners android:radius="10dp"/>
            <solid android:color="#ffE0E6FF"/>
            <padding android:left="10dp"
                android:top="10dp"
                android:right="10dp"
                android:bottom="10dp"/>
            <stroke android:width="2dp" android:color="#ff777B88"/>
        </shape>
    </item>
</selector>
```

Custom
Button

Custom
Button

Appendix E: Customizing Widgets

Resource: res/drawable/custom_edittext.xml

The rendition of the custom made EditText widget is based on three states: normal, state_focused, state_pressed.

```
<?xml version="1.0" encoding="utf-8"?>
<selector xmlns:android="http://schemas.android.com/apk/res/android">

<item android:state_pressed="true">
    <shape android:shape="rectangle">
        <gradient
            android:angle="90"
            android:centerColor="#FFffffff"
            android:endColor="#FFffcc00"
            android:startColor="#FFffffff"
            android:type="linear" />

        <stroke android:width="2dp" android:color="#FFff6600" />
        <corners android:radius="0dp" />
        <padding android:left="10dp"
            android:top="6dp"
            android:right="10dp"
            android:bottom="6dp" />
    </shape>
</item>
```

Custom EditText Box

Appendix E: Customizing Widgets

Resource: res/drawable/custom_edittext.xml

The rendition of the custom made EditText widget is based on three states: normal, state_focused, state_pressed.

```
<item android:state_focused="true">
    <shape>
        <solid android:color="#FFffffff" />
        <stroke android:width="2dp" android:color="#FFff6600" />
        <corners android:radius="0dp" />
        <padding android:left="10dp"
            android:top="6dp"
            android:right="10dp"
            android:bottom="6dp" />
    </shape>
</item>

<item>
    <!-- state: "normal" not-pressed & not-focused -->
    <shape>
        <stroke android:width="1dp" android:color="#ff777777" />
        <solid android:color="#ffffffff" />
        <corners android:radius="0dp" />
        <padding android:left="10dp"
            android:top="6dp"
            android:right="10dp"
            android:bottom="6dp" />
    </shape>
</item>
</selector>
```
