## In-situ leach mining

Yava Technologies Inc.

Yava Technologies Inc. has developed a low-cost, environmentally friendly process to recover value-added minerals from the large sandstone deposit at the Yava site near Sydney, Nova Scotia. Yava's process employs in-situ leach mining utilizing an environmentally friendly leachant that is injected via a well system into the ore body. The leachant dissolves the targeted minerals that are brought to surface as leachate for onsite recovery as value-added products at a fraction of the cost of conventional hard-rock mining methods. The process, currently applicable to the recovery and processing of certain sulphide-base ores from porous ore bodies and tailings dumps, results in significantly lower GHG emissions than those normally associated with mining and smelting operations.
