

Hip Roof Models

Hip Roof Model : Hip Run = 1

Trigonometric Scaling

The model of the Hip Roof may be drawn to **any** scale. All angles remain equal, all lengths remain proportional. Trigonometric scaling creates right triangles which readily produce formulas relating angles on different faces of the model.

Hip Run = 1

Hip Length = $1 \div \cos$ Hip Pitch Angle

Hip Rise = Common Rise = \tan Hip Pitch Angle

Common Run = \sin Deck Angle

Common Length = $\frac{\sin \text{ Deck Angle}}{\cos \text{ Common Pitch Angle}}$

Eave = \cos Deck Angle

Development of Hip Roof Model : Hip Run = 1

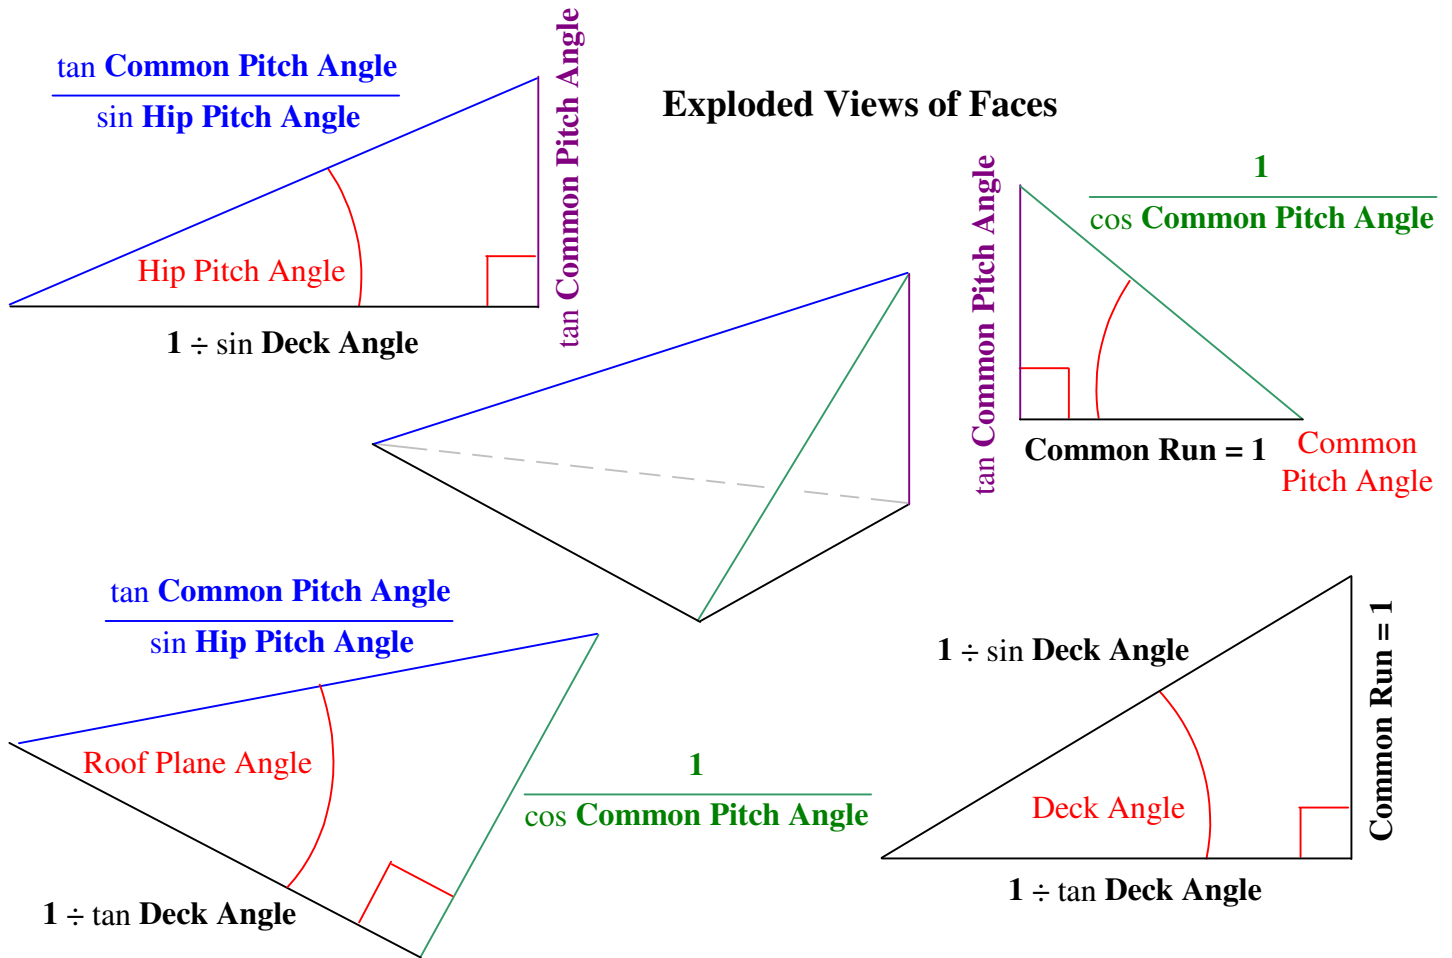

The triangles in the previous diagram have been juxtaposed about the triangle of the **Deck Angle**.

All lengths may be multiplied by any convenient factor to create a development with a workable scale.

Edges highlighted the same color are of equal length; most of the development can be drawn using only a compass and straightedge.
